11/13/1992

NET Job Number: 92.50181

Enclosed are the Analytical Results for the following samples submitted to NET, Inc. Bartlett Division for analysis:

Project Description: 496B; Springfield

Sample Number	Sample Description	Date Taken	Date Received
186568	P-7D; SS-4; Soil		11/03/1992
186569	B-9; SS-8; Soil		11/03/1992
186570	CB-9; SS-5; Soil		11/03/1992

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

Report of Lab Test

PROJECT:	CWLP	**PROJECT NO:**	418834
		DATE OF TEST	June 03, 2024
CLIENT:	Andrews Engineering	**REPORT NUMBER:**	418834-01
ATTN:	Mr. Brad Hunsberger	**PAGE NO.**	1/1

ITEM: **PERMEABILITY TEST RESULTS**

Sample	Moisture Content (%)		Dry Unit Weight (PCF)	Permeability (Cm./Sec.)
	Before Test	After Test		
L4 (17'-19')	37.6	31.5	89.2	1.7 x 10-8
D3 (29.5'-31.5')	27.0	26.6	98.4	2.1 x 10-6
D1 (38.5'-40.5')	23.1	22.9	105.6	5.1 x 10-8
L5 (37.5'-39.5')	23.2	22.4	103.6	6.8 x 10-6
D2 (35.5'-37.5')	25.2	25.0	98.8	2.8 x 10-7
L3 (34.5'-36.5')	24.3	30.4	94.1	8.5 x 10-8
L1 (36'-38')	26.5	25.9	98.2	4.5 x 10-7
D4 (34.5'-36.5')	27.8	23.0	99.4	1.4 x 10-6

NOTES: Test ran according to ASTM D-5084

NOTES

1. FLIGHT DATE: APRIL 2023.
2. POTENTIOMETRIC CONTOUR INTERVAL SHOWN IS 10 FEET.
3. TOPOGRAPHIC CONTOUR INTERVAL SHOWN IS 2 FEET.
4. SAMPLING DATE: 10/26/2023.
5. SUGAR CREEK SURFACE WATER ELEVATION IS BASED ON AVERAGE OF USGS GAGE 05576250 FOR 10/26/2023.
6. ESTIMATED GROUNDWATER ELEVATION OF 552 FT MSL IS BASED ON VIBRATING WIRE PIEZOMETERS B-1CCR, B-2CCR, AND B-3CCR INSTALLED IN AND ADJACENT TO THE LAKESIDE ASH POND.
7. BOUNDARIES OF THE SITE FEATURES ARE APPROXIMATE.
8. (*) – DATA NOT USED TO CREATE CONTOURS.

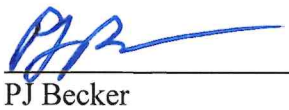
RE: CCR Surface Impoundments
Addendum to Nature and Extent Report September 2026

Dear Ms. Dierich:

In accordance with USEPA comments received by CWLP on August 11, 2026, provided herein is an addendum to the Nature and Extent Report for the CCR Surface Impoundments that was originally submitted on September 23, 2025. Specifically, this addendum provides additional information from the relevant portions of the Agreement to Resolve investigations completed in July 2026.

Should you have any questions or require additional information, please contact me at 217-757-8610 ext. 1110.



Sincerely,

PJ Becker
Environmental Health and Safety Manager

Certification of City Water, Light and Power

City of Springfield, Office of Public Utilities, d/b/a City Water, Light and Power provides the following certification as required by paragraph 300 of the Consent Agreement and Final Order effective January 14, 2025.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I have no personal knowledge that the information submitted is other than true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

EXECUTIVE SUMMARY

This Addendum supplements the September 2025 *Nature and Extent Report* for the Dallman and Lakeside Coal Combustion Residual (CCR) Surface Impoundments. Its purpose is to incorporate information collected pursuant to the Agreement to Resolve (AOR), address comments received from the U.S. Environmental Protection Agency (EPA) on August 11, 2026, and update the characterization of arsenic occurrence, distribution, and potential migration from CCR source areas.

The AOR investigation included advancement of additional borings; installation of monitoring wells AW4, AW5, AW6, and AP17; collection of groundwater elevation and quality data; and refinement of hydrogeologic interpretations. Historical groundwater monitoring data and information generated during the AOR investigation were evaluated to update the conceptual site model, groundwater flow interpretations, arsenic plume delineation, and arsenic release calculations. The resulting evaluation refines the hydrogeologic conceptual site model presented in the June 2025 *Nature and Extent Report*, the September 2025 *Updated Nature and Extent Report*, and the September 2025 *Flow Path Report*.

The additional investigation refined the understanding of several hydrogeologic features identified during EPA's review of previous submittals. Available hydrogeologic data indicate that the shallow sand unit is a potential groundwater migration pathway where saturated and hydraulically connected conditions exist. The shallow sand unit has been incorporated into the conceptual site model and the evaluation of potential contaminant migration. Hydrostratigraphic mapping and geologic cross-sections indicate that the unit remains limited in thickness, lateral extent, and overall areal distribution across much of the Site. Although portions of the shallow sand unit may be hydraulically connected to adjacent groundwater-bearing intervals, the unit does not form a laterally continuous groundwater-bearing zone beneath or surrounding the CCR units. While the shallow sand unit may facilitate localized groundwater migration in certain areas, groundwater monitoring data indicate that arsenic impacts remain primarily associated with the basal sand/weathered-bedrock aquifer.

The investigation also provided additional information regarding the former creek alignment east of the Dallman Ash Pond. Portions of the former creek channel contain soft alluvial and fill materials associated with adjacent groundwater-bearing intervals and saturated sand deposits capable of transmitting groundwater more readily than adjacent cohesive deposits. Consequently, portions of the former creek channel are considered potential localized groundwater flow and preferential migration pathways and have been incorporated into the conceptual site model. These features may have contributed to groundwater and constituent migration from hydraulically upgradient CCR source areas where favorable hydraulic connections exist.

Groundwater monitoring data continue to demonstrate the presence of arsenic within the basal sand/weathered-bedrock aquifer. The occurrence of arsenic within this hydrostratigraphic interval, when evaluated together with hydraulic and hydrogeologic information, supports hydraulic communication between CCR source areas and the uppermost aquifer. The available data support a conceptual model in which arsenic migration to the basal sand/weathered-bedrock aquifer likely results from long-term downward migration under sustained hydraulic gradients associated with nearly five decades of CCR management activities, potentially enhanced by localized groundwater migration pathways associated with the shallow sand unit and portions of the former creek channel where favorable hydraulic conditions exist. While the additional investigation improves understanding of potential migration pathways, the available data do not identify a single discrete migration pathway that accounts for all observed groundwater impacts.

Groundwater monitoring results collected under the AOR were incorporated into an evaluation of arsenic distribution at the Site. The expanded monitoring network improves spatial coverage and provides additional confidence in the delineation of the arsenic plume. GWSDAT analyses indicate that arsenic impacts remain primarily associated with groundwater within the basal sand/weathered-bedrock aquifer. Incorporation of the AOR monitoring locations improved delineation of plume boundaries and refined the understanding of arsenic migration pathways. Although the overall plume configuration remains generally consistent with historical groundwater monitoring observations, temporal variability is evident in plume area, concentration distributions, and normalized dissolved plume mass. The additional data supports refinement of the conceptual site model and groundwater release characterization.

Arsenic release calculations were completed using the expanded groundwater monitoring dataset and revised plume interpretation developed from the AOR investigation. Differences between the 2025 and 2026 estimates primarily reflect improved delineation of plume boundaries and concentration distributions resulting from additional monitoring data rather than evidence of a substantial change in release conditions. Collectively, the AOR investigation addresses EPA's concerns regarding the hydrogeologic significance of the shallow sand unit, the former creek channel, and hydraulic communication between CCR source areas and the uppermost aquifer while improving confidence in the delineation of the arsenic plume.

Principal Findings

- The additional AOR investigation refined the hydrogeologic conceptual site model and improved understanding of groundwater migration pathways.
- The shallow sand unit is recognized as a potential groundwater migration pathway where saturated and hydraulically connected conditions exist.
- Portions of the former creek channel may function as localized groundwater flow and preferential migration pathways.

- Groundwater quality, hydraulic, and hydrogeologic information supports hydraulic communication between CCR source areas and the basal sand/weathered-bedrock interval.
- Available data support a conceptual model involving long-term downward migration under sustained hydraulic gradients, potentially enhanced by localized preferential pathways.
- Additional monitoring wells improved delineation of arsenic plume boundaries and reduced uncertainty in plume geometry.
- Arsenic concentrations above the groundwater protection standard (GWPS) remain primarily associated with monitoring locations completed within the basal sand/weathered-bedrock interval.
- Arsenic release calculations reflect improved plume delineation and enhanced characterization resulting from additional monitoring locations.
- The AOR investigation refined delineation and characterization of the arsenic release and improved confidence in the interpretation of its nature and extent.

1. INTRODUCTION

1.1 Background

City Water, Light, and Power (CWLP) submitted the September 2025 *Nature and Extent Report* to document the occurrence and distribution of groundwater impacts associated with the Dallman Ash Pond (DAP) and Lakeside Ash Pond (LAP) coal combustion residual (CCR) units and to evaluate potential relationships between those groundwater conditions and the CCR units. The DAP and LAP CCR units are located at the CWLP generating station site in Springfield, Illinois (Figure 1). The report evaluated available groundwater monitoring, hydrogeologic, and analytical data and presented the conceptual understanding of the nature and extent of arsenic impacts within the uppermost aquifer.

Following its review of the *Nature and Extent Report* and associated CCR corrective action documents, EPA issued comments on August 11, 2026, requesting additional evaluation of groundwater migration pathways, incorporation of newly collected hydrogeologic information, and preparation of an addendum. EPA specifically requested additional evaluation of the shallow sand unit, former creek alignment and fill areas, hydraulic communication between the CCR units and the uppermost aquifer, information generated pursuant to the Agreement to Resolve (AOR), arsenic release characterization and calculations, and groundwater contamination plume maps. This Addendum was prepared to address those comments and incorporate the results of additional investigation completed since submittal of the September 2025 *Nature and Extent Report*.

Since issuance of the September 2025 report, CWLP has completed additional hydrogeologic investigation and groundwater monitoring activities pursuant to the AOR. The resulting information has been incorporated into this Addendum and evaluated together with historical groundwater monitoring data to refine groundwater flow interpretations, the conceptual site model, arsenic plume delineation, and arsenic release estimates. The evaluation refines the hydrogeologic conceptual site model previously developed for the Site by incorporating additional information regarding groundwater migration pathways, hydraulic communication between hydrostratigraphic units, and the distribution of arsenic impacts within the uppermost aquifer. Consistent with EPA's comments, the revised evaluation considers the shallow sand unit and portions of the former creek alignment as potential groundwater migration pathways where favorable hydraulic conditions exist and reevaluates their relevance to arsenic migration and plume development.

1.2 Objectives

The objectives of this Addendum are to present the results of the investigation completed pursuant to the AOR and evaluate how the additional information affects the conceptual understanding of groundwater impacts associated with the CCR units. Specifically, this Addendum:

- Presents new groundwater monitoring and flow-path information collected pursuant to the AOR.
- Updates the conceptual site model to incorporate additional hydrogeologic information.
- Evaluates the hydrogeologic significance of the shallow sand unit and former creek alignment as potential groundwater migration pathways.
- Evaluates groundwater migration pathways and hydraulic communication between the CCR units and the uppermost aquifer.
- Reevaluates the nature and extent of arsenic in groundwater and its potential relationship to CCR source areas.
- Updates arsenic release calculations using the expanded monitoring dataset.
- Presents groundwater plume maps developed using historical and newly collected groundwater monitoring data.
- Assesses whether the additional information materially changes previous interpretations regarding groundwater impacts, plume geometry, and arsenic occurrence within the uppermost aquifer.

The evaluation presented herein focuses on arsenic because it is the Appendix IV constituent currently defining the groundwater impact area associated with the DAP and LAP CCR units. Arsenic was specifically identified by EPA for additional evaluation as part of the requested Nature and Extent Addendum and remains the primary constituent used to evaluate the nature and extent of groundwater impacts associated with the CCR units.

2. SUMMARY OF AGREEMENT TO RESOLVE INVESTIGATION

2.1 Investigation Activities

Additional investigation was completed pursuant to the AOR to further evaluate groundwater conditions, groundwater migration pathways, hydraulic communication between the CCR units and the uppermost aquifer, and the distribution of arsenic impacts associated with the DAP and LAP CCR units. The investigation was designed to address issues identified by EPA during its review of the September 2025 *Nature and Extent Report* and *Flow Path Report*, including the hydrogeologic significance of the shallow sand unit, the former creek alignment and fill area east

of the Dallman Ash Pond, hydraulic communication between hydrostratigraphic units, and delineation of arsenic impacts downgradient of the Dallman Ash Pond.

2.1.1 Borings Completed

An additional subsurface investigation was completed to provide hydrogeologic information in areas identified during the EPA's review and to support the installation of new monitoring locations. The investigation program included advancement of AW-series borings (AW4, AW5, and AW6) and an AP-series boring (AP17).

Information obtained from these borings was used to refine site stratigraphic interpretations; evaluate groundwater conditions, potential groundwater migration pathways, and hydrogeologic conditions associated with the shallow sand unit and former creek alignment; and support development of geologic cross-sections, hydrostratigraphic mapping, and groundwater flow-path interpretations. The borings also provided additional information regarding hydraulic communication between CCR source areas and the uppermost aquifer. Boring logs completed during the AOR investigation are provided in Appendix A.

2.1.2 Monitoring Wells Installed

Additional groundwater monitoring wells were installed to improve delineation of groundwater conditions and arsenic impacts in areas where existing monitoring coverage was limited. The wells also provide additional hydrogeologic and groundwater quality information in areas identified by EPA as requiring further evaluation.

The AW-series and AP-series monitoring locations were installed to improve understanding of groundwater conditions downgradient of the Dallman Ash Pond, evaluate potential groundwater migration pathways associated with the shallow sand unit and former creek alignment, assess hydraulic communication between the CCR units and the uppermost aquifer, and improve delineation of arsenic impacts within the uppermost aquifer. Monitoring well locations are shown on Figure 2 and construction details are provided in Appendix B.

As agreed in the AOR, the new monitoring wells were sampled during the second- and third-quarter 2026 groundwater monitoring events.

2.1.3 Groundwater Monitoring

Groundwater monitoring was completed following installation and development of the new monitoring wells. Monitoring activities included:

- Collection of groundwater samples from new and existing monitoring wells;
- Analysis of groundwater samples for arsenic and other site monitoring parameters;

- Measurement of groundwater elevations; and
- Incorporation of the resulting data into the site groundwater monitoring database.

The expanded groundwater monitoring dataset was used to update groundwater flow interpretations, evaluate arsenic concentrations within the uppermost aquifer, assess hydraulic communication between the CCR source areas and the basal sand/weathered-bedrock aquifer, refine understanding of potential groundwater migration pathways associated with the shallow sand unit and former creek alignment, develop plume maps, and support the nature and extent evaluation presented in this Addendum. Groundwater analytical results generated during the monitoring program are provided in Appendix C.

3. HYDROGEOLOGIC INTERPRETATION

3.1 Shallow Sand Unit

Additional hydrogeologic information collected under the AOR was evaluated together with historical boring logs, monitoring well data, and geologic cross-sections to reassess the distribution and hydraulic significance of the shallow sand unit. The shallow sand unit occurs as a discontinuous geologic feature within the upper portion of the alluvial sequence and exhibits variable thickness and lateral continuity across the Site. Available boring logs and cross-sections indicate that the unit is not laterally extensive and is absent in significant portions of the study area. Revised geologic cross-section G-G' and new cross-sections Q-Q' and R-R', which illustrate hydrostratigraphic conditions at the new AW and AP borings, are presented in Appendix D.

The distribution of the shallow sand unit was further evaluated using hydrostratigraphic isopach mapping completed as part of the *Flow Path Report* investigation. Hydrostratigraphic structure contour and isopach maps originally developed for the September 2025 *Flow Path Report* were updated to incorporate boring information from AW4, AW5, AW6, and AP17. The revised mapping confirms the previously interpreted extent of the shallow sand unit and does not materially alter the conceptual understanding of its distribution beneath the Site. Shallow Sand Surface and Shallow Sand Isopach maps are included in Appendix E. The isopach mapping indicates that the shallow sand unit is discontinuous and exhibits limited thickness and lateral extent across much of the Site. The mapped distribution supports the interpretation that the shallow sand occurs as isolated to semi-continuous depositional features rather than a laterally extensive aquifer unit. The isopach maps also provide a basis for evaluating areas where saturated shallow sand may be hydraulically connected to adjacent groundwater-bearing units and therefore capable of transmitting groundwater and dissolved constituents.

Groundwater monitoring and subsurface investigations indicate that portions of the shallow sand unit are saturated and hydraulically connected to adjacent unconsolidated deposits. Installation of monitoring wells AP15S and AP15D confirmed the presence of a saturated shallow sand

interval west of Lakeside Ash Pond and provided additional information regarding hydraulic relationships between the shallow sand unit and the underlying basal sand aquifer. Where saturated conditions and hydraulic connectivity exist, the shallow sand unit has the potential to transmit groundwater and dissolved constituents and, therefore, is recognized as a potential groundwater migration pathway. Available hydrogeologic data indicate that hydraulic connectivity exists within portions of the shallow sand unit, and those portions have been incorporated into the conceptual site model as groundwater migration pathways. While localized hydraulic connectivity has been identified, the mapped distribution indicates that the shallow sand unit remains limited in overall areal extent and occurs as discontinuous depositional features rather than a regionally continuous aquifer. Consequently, any groundwater migration associated with the shallow sand unit is expected to be localized to areas where saturated and hydraulically connected conditions exist.

The additional monitoring wells installed pursuant to the AOR provide improved spatial control in areas where the shallow sand unit is present. These data support recognition of the shallow sand as a localized groundwater migration pathway while also indicating that groundwater impacts associated with the arsenic plume remain principally associated with the basal sand/weathered-bedrock aquifer.

3.2 Former Creek Channel / Fill Area

Historical boring logs, recent AOR borings, geologic cross-sections, and hydrostratigraphic isopach mapping were reviewed to evaluate the former creek alignment along the eastern side of the Dallman Ash Pond. The combined data indicate that portions of the former channel contain soft alluvial and fill materials that differ from the surrounding fine-grained deposits. Historical boring logs P-01D and P-02D, as well as more recent borings B-4 and B-8U, indicate that the clay/fill intervals were generally described as moist or wet rather than saturated. While the boring logs do not consistently characterize the fill materials themselves as saturated, the data indicate the presence of groundwater-bearing intervals and saturated sand deposits adjacent to and beneath portions of the former channel area. These conditions suggest that the former creek corridor may locally influence groundwater movement and contaminant migration. The distribution of these materials generally follows the mapped alignment of the former creek channel and is consistent with observations documented in both historical and recent borings. Supporting boring logs and subsurface information are provided in Appendix A.

Site development activities associated with construction of the surface impoundments likely altered portions of the original creek channel through excavation and placement of engineered fill materials beneath embankment structures. Consequently, the available information does not support interpretation of a continuous preferential pathway beneath the Site. However, portions of the former creek alignment that were not excavated or substantially modified may retain hydraulically conductive alluvial materials capable of transmitting groundwater more readily than

adjacent cohesive deposits. Although the boring logs do not consistently document saturated conditions within the clay/fill materials themselves, the occurrence of adjacent saturated sands, groundwater-bearing intervals, and low-strength alluvial deposits indicates that portions of the former creek alignment may provide localized hydraulic connectivity relative to the surrounding cohesive deposits.

The available data support the interpretation that portions of the former creek alignment along the eastern margin of the Dallman Ash Pond may function as localized groundwater flow paths and preferential migration pathways. Groundwater monitoring and subsurface information indicate that these materials may provide localized hydraulic communication between the CCR source area and underlying groundwater-bearing units and, therefore, represent an important component of the conceptual site model.

Hydrostratigraphic structure contour and isopach maps (Appendix E) demonstrate that incorporating the AOR boring information generally corroborates the hydrogeologic framework developed for the September 2025 *Flow Path Report* while refining interpretations of localized hydrostratigraphic variability relevant to groundwater migration pathways. The figures depict the upper cohesive deposit surface and thickness, lower cohesive deposit surface and thickness, basal sand surface and thickness, and bedrock surface. These figures have been revised to incorporate information obtained from the new borings.

Geologic contacts encountered in the AOR borings were generally consistent with those documented in adjacent historical borings. As a result, incorporation of the new drilling information did not materially modify previously interpreted hydrostratigraphic surfaces, unit thicknesses, or depositional relationships. The mapping, therefore, confirms the hydrogeologic framework developed for the September 2025 *Flow Path Report* while providing additional confidence in the interpreted horizontal and vertical extent of the principal hydrostratigraphic units.

Historical boring logs, including P02D, together with the recent AOR investigation, indicate that portions of the former creek corridor contain soft alluvial and fill materials associated with adjacent groundwater-bearing intervals. These observations support consideration of the former creek alignment as a potential preferential groundwater migration pathway in portions of the Site where hydraulic connectivity exists.

3.3 Hydraulic Communication to the Basal Sand Aquifer

Groundwater monitoring data collected since initiation of assessment monitoring continue to document arsenic within the basal sand and weathered-bedrock interval that comprises the uppermost aquifer beneath the CCR units. Arsenic concentrations above the groundwater protection standard have been documented in multiple monitoring wells completed within this interval, including historical and recently installed monitoring locations.

The occurrence of arsenic within the uppermost aquifer indicates that constituent migration from CCR source areas has occurred. Groundwater impacts within the basal sand and weathered-bedrock interval are consistent with the long operational history of the CCR units and the downward hydraulic gradients identified beneath the surface impoundments. The Dallman and Lakeside surface impoundments have been present since approximately 1976, resulting in nearly five decades of potential source loading. Under sustained downward gradients, long-term vertical migration through lower-permeability deposits provides a plausible mechanism for constituent transport to the uppermost aquifer.

Groundwater monitoring results indicate that arsenic is present in wells located along the western, northern, and eastern portions of the Dallman Ash Pond area. The presence of arsenic within wells completed in the basal sand and weathered-bedrock interval supports hydraulic communication between the CCR source areas and the uppermost aquifer. Collectively, groundwater quality, hydraulic, and hydrogeologic observations support hydraulic communication between CCR source areas and the uppermost aquifer and indicate that one or more groundwater migration mechanisms represented in the conceptual site model are operative at the Site.

For purposes of the Nature and Extent evaluation, the interpreted groundwater migration pathway represents the inferred route through which groundwater and dissolved constituents may migrate from CCR source areas to and through the uppermost aquifer. The pathway may include long-term downward migration through lower-permeability deposits, together with localized preferential migration through saturated creek-fill materials, shallow sand, portions of the former creek alignment, basal sand, and hydraulically connected weathered materials near the bedrock interface. The occurrence, thickness, continuity, and relative hydraulic contribution of these materials vary across the Site.

Groundwater elevation data collected throughout the monitoring period indicate that the regional groundwater flow regime is modified by localized hydraulic controls at the Site. Potentiometric surface evaluations consistently indicate the presence of a groundwater trough associated with the Flue Gas Desulfurization System (FGDS) disposal area, which induces an eastward groundwater-flow component from portions of the Dallman Ash Pond area toward the FGDS area. In addition, Sugar Creek functions as a local groundwater convergence feature and exerts hydraulic control along portions of the northern and western site boundaries. These hydraulic features appear to influence groundwater migration within the uppermost aquifer and represent important components of the conceptual site model.

The available data do not identify a single discrete pathway that accounts for all observed groundwater impacts. Likewise, the presence of arsenic within the basal sand and weathered-bedrock interval does not require a single, uninterrupted preferential pathway extending directly from the bottom of the surface impoundments to the uppermost aquifer. Rather, the available

evidence is consistent with a conceptual model (Figure 3) involving long-term downward migration through lower-permeability deposits under sustained hydraulic gradients, potentially supplemented by localized preferential migration through portions of the shallow sand and former creek corridor where hydraulic connectivity exists.

Once constituents reach the uppermost aquifer, groundwater and dissolved constituents may move laterally through the interconnected groundwater-bearing materials comprising the interpreted groundwater migration pathway. Depending on location, these materials include creek-fill deposits, shallow sand, basal sand, and hydraulically connected weathered materials near the bedrock interface. The geologic cross-sections and isopach drawings support interpretation of the basal sand and weathered-bedrock interval as an important groundwater-bearing component of this pathway beneath the Site.

The occurrence of arsenic within the uppermost aquifer supports hydraulic communication between CCR source areas and the groundwater-bearing basal sand/weathered-bedrock interval. This conclusion refines previous interpretations regarding the degree of hydraulic separation between the CCR units and the uppermost aquifer and incorporates the additional information collected during the AOR investigation. The AOR investigation and hydrogeologic evaluation indicate that groundwater impacts observed within the basal sand/weathered-bedrock aquifer are consistent with long-term migration from CCR source areas under sustained downward hydraulic gradients. Available data further indicate that localized migration may be enhanced by hydrogeologic features such as the shallow sand unit and portions of the former creek alignment where favorable hydraulic conditions exist. Collectively, the available information supports a conceptual model in which constituent migration reflects a combination of long-term downward migration through lower-permeability deposits and localized preferential migration through more permeable hydrogeologic features, rather than movement through a single discrete or uniformly continuous pathway. This interpretation addresses EPA comments regarding hydraulic communication, groundwater migration pathways, and the occurrence of arsenic within the uppermost aquifer.

4. GROUNDWATER MONITORING RESULTS

4.1 Groundwater Elevations

Groundwater elevation data collected during the AOR investigation were incorporated into a potentiometric surface evaluation of the uppermost aquifer. The dataset includes water-level measurements obtained from newly installed monitoring wells AW4, AW5, AW6, AP15D, AP15S, AP16, and AP17, in addition to the existing monitoring network. Groundwater elevation measurements collected between November 2025 and July 2026 are summarized in Table 1 and provide a basis for evaluating groundwater flow conditions and hydraulic relationships among

hydrostratigraphic units during the AOR investigation. July 2026 groundwater elevations were used to prepare the potentiometric surface map presented in Figure 4.

Groundwater elevations summarized in Table 1 indicate generally consistent groundwater conditions over the monitoring period and support interpretation of a stable groundwater flow regime within the uppermost aquifer. Groundwater movement within the basal sand/weathered-bedrock aquifer remains generally controlled by regional topography and convergence toward Sugar Creek. However, potentiometric surface maps consistently indicate the presence of a localized groundwater trough associated with the FGDS Development Unit 2 area that modifies the regional flow regime and induces an eastward component of groundwater flow from portions of the Dallman Ash Pond area toward the FGDS area.

Groundwater elevations further indicate convergence toward Sugar Creek from both the east and west, supporting interpretation of Sugar Creek as a local groundwater convergence feature. The persistence of these groundwater flow characteristics throughout the monitoring period suggests that localized hydraulic controls associated with the FGDS Development Unit 2 area and Sugar Creek continue to influence groundwater movement and arsenic plume geometry within the uppermost aquifer.

The additional monitoring locations installed pursuant to the AOR provide improved water-level control in areas identified by EPA for further evaluation, including the shallow sand unit and former creek alignment. These data improve understanding of groundwater migration pathways, hydraulic communication between the CCR source areas and the uppermost aquifer, and the hydrogeologic conditions influencing arsenic occurrence and migration.

Overall, the groundwater elevation dataset supports and refines the conceptual site model presented in the September 2025 *Nature and Extent Report* and provides additional confidence regarding groundwater flow directions, hydraulic relationships between monitored hydrostratigraphic units, and migration pathways incorporated into the conceptual site model.

4.2 Arsenic Results

Groundwater samples collected during the AOR investigation were analyzed for arsenic, and the results were incorporated into the site groundwater monitoring database. The new monitoring locations provide additional information regarding arsenic concentrations in areas where plume boundaries and potential migration pathways require further evaluation. Arsenic concentrations detected in the newly installed monitoring wells are summarized in Table 2. Arsenic was detected in all AOR monitoring wells, with the highest concentrations occurring at AW6 and concentrations near or below the groundwater protection standard occurring at AW4, AW5, and AP17. These results provide additional information regarding arsenic distribution downgradient of the Dallman Ash Pond and improve delineation of plume geometry within the uppermost aquifer.

Complete groundwater analytical data are provided in Appendix C. Arsenic concentrations detected in AW4, AW5, AW6, and AP17 generally fall within the range of concentrations previously observed in downgradient monitoring locations and are consistent with the existing conceptual understanding of plume distribution.

Among the newly installed monitoring locations, the highest arsenic concentrations were observed at AW6, while lower concentrations were observed at AW4, AW5, and AP17. The occurrence of arsenic in these locations is consistent with previously documented impacts within the basal sand/weathered-bedrock aquifer and supports interpretation of hydraulic communication between CCR source areas and the uppermost aquifer. The concentrations detected at these wells generally corroborate previously interpreted plume geometry while providing additional control on plume margins and improved delineation of arsenic impacts downgradient of the DAP.

The dataset was incorporated into the GWSDAT evaluation and plume mapping presented later in this Addendum. The additional analytical data improve confidence in plume interpretation, provide a more complete characterization of arsenic distribution within the uppermost aquifer, and improve understanding of groundwater migration pathways and plume geometry in areas previously characterized by greater uncertainty.

4.3 Data Evaluation

The AOR monitoring wells were installed to improve understanding of groundwater conditions in areas where additional information was needed to evaluate groundwater migration pathways, assess hydraulic communication, and refine delineation of arsenic impacts. Data obtained from AW4, AW5, AW6, and AP17, together with other AOR investigation results, provide improved spatial coverage between existing monitoring locations and allow a more detailed evaluation of groundwater quality conditions near the DAP.

The additional data support the interpretation that arsenic impacts remain primarily associated with groundwater within the basal sand/weathered-bedrock aquifer. The new monitoring locations also provide information relevant to the evaluation of the shallow sand unit and former creek alignment discussed in Section 3. While these data improve understanding of groundwater migration pathways and hydraulic communication, they do not indicate previously unidentified, widespread arsenic impacts beyond the plume boundaries interpreted in the September 2025 *Nature and Extent Report*. Rather, the results improve confidence in the previously interpreted nature and extent of groundwater impacts while reducing uncertainty regarding plume boundaries and migration pathways.

The expanded monitoring network reduces uncertainty regarding plume geometry and improves delineation of the arsenic plume for groundwater mapping and release calculations. Incorporating the new data into the GWSDAT analysis refined plume contours and associated plume metrics and improved understanding of migration pathways and the distribution of arsenic impacts within the uppermost aquifer.

5. NATURE AND EXTENT OF ARSENIC IMPACTS

5.1 GWSDAT Evaluation

The GroundWater Spatiotemporal Data Analysis Tool (GWSDAT) is a widely used, peer-reviewed groundwater monitoring data evaluation tool that has been applied to plume characterization, plume stability assessment, monitoring network optimization, and site closure evaluations. The methodology has been described in peer-reviewed publications and has been the subject of EPA-sponsored technical training through the CLU-IN program[1].

Groundwater arsenic data were evaluated using GWSDAT, which applies spatiotemporal smoothing and regression techniques to groundwater monitoring data to generate continuous concentration surfaces, evaluate plume behavior through time, and calculate diagnostic plume metrics including plume area, average plume concentration, and normalized plume mass[2]. The evaluation incorporated historical groundwater monitoring data together with data obtained from monitoring wells installed pursuant to the AOR, including AW4, AW5, AW6, and AP17. The dataset included groundwater analytical results, monitoring well coordinates, and groundwater elevation information from 2016 through July 2026. GWSDAT input data and output files are provided in Appendix F. Documentation for the GWSDAT groundwater monitoring data evaluation tool is provided in Appendix G.

GWSDAT analyses were completed using laboratory-reported analytical values. Non-detect results were retained as reported in the dataset and were not adjusted through substitution of reporting limits or fractions of reporting limits. Accordingly, calculated plume metrics reflect the monitored groundwater dataset without the introduction of additional conservatism associated with non-detect substitution methods.

[2] Jones, W.R., Spence, M.J., and Bonte, M. (2015). *Analyzing Groundwater Quality Data and Contamination Plumes with GWSDAT*. Groundwater, 53(4), 513-514. https://doi.org/10.1111/gwat.12340.

The evolution of the arsenic plume is depicted in the output file included in Appendix F. GWSDAT reports dissolved plume mass as kilograms per foot (kg/ft), representing contaminant mass normalized to saturated plume thickness. Consequently, plume mass values provide a consistent basis for evaluating relative changes in plume magnitude and plume behavior through time.

GWSDAT plume statistics were calculated using an arsenic threshold concentration of 23.9 µg/L corresponding to the arsenic groundwater protection standard (GWPS). The effective porosity value is based on published saturation water content data for sandy materials reported by Sharp-Hansen et al., which indicate a representative range of approximately 37 to 49 percent. The mean value of 43 percent was adopted as representative of the basal sand/weathered-bedrock aquifer for purposes of plume metric evaluation. Use of the 23.9 µg/L threshold concentration is consistent with the arsenic groundwater protection standard and provides a consistent basis for evaluating changes in the delineated plume through time.

GWSDAT results indicate that the delineated arsenic plume remains localized and generally consistent with historical groundwater monitoring observations, although temporal variability is evident in plume area, concentration distributions, and normalized dissolved plume mass (Figure 5). Observed fluctuations likely reflect a combination of changes in groundwater conditions, monitoring density, sampling frequency, and interpolation associated with expansion of the monitoring network. Incorporation of the AOR monitoring locations improves confidence in plume delineation and provides a more robust characterization of plume geometry and concentration distributions. The evaluation provides a more refined understanding of plume geometry, plume boundaries, and concentration distributions through incorporation of the AOR monitoring locations and the expanded 2026 analytical dataset. Resulting plume metrics are shown on the figures in Appendix F. The GWSDAT evaluation provides additional quantitative support for characterization of plume geometry, arsenic distribution, and groundwater migration patterns and serves as the basis for the revised nature and extent interpretation presented in this Addendum. Recent applications of GWSDAT have demonstrated its utility for plume characterization, plume stability assessment, evaluation of monitoring network adequacy, groundwater trend analysis, and support of regulatory decision-making at contaminated groundwater sites.[3] The GWSDAT results provide additional information for evaluating the extent of groundwater impacts identified through the AOR investigation and support refinement of the conceptual site model and plume characterization requested by EPA.

Groundwater plume delineation may also be performed using conventional spatial interpolation methods, such as kriging, applied to analytical results from a single groundwater monitoring event (Figure 6). While such methods are useful for visualizing groundwater conditions during a specific

[3] Jones, W.R., Rock, L., Wesch, A., Marzusch, E., and Low, M. (2022). “Groundwater Spatiotemporal Data Analysis Tool: Case Studies, New Features and Future Developments.” *Groundwater Monitoring & Remediation*, 42(3), 14-22.

monitoring period, the resulting plume geometry reflects conditions at a single point in time and may be influenced by short-term variability in groundwater elevations, concentration distributions, monitoring density, and analytical variability. Alternatively, plume maps generated using the maximum concentration observed during multiple monitoring events may represent a conservative depiction of groundwater impacts; however, such evaluations may combine concentrations that were not observed simultaneously and, therefore, may not represent plume geometry during any individual monitoring period.

In contrast, GWSDAT evaluates groundwater concentrations as a function of both spatial location and time through a spatiotemporal modeling framework. The resulting concentration surfaces incorporate the full groundwater monitoring dataset and provide a representation of long-term groundwater conditions rather than conditions associated with a single monitoring event. Consequently, the annual GWSDAT plume interpretations presented in this Addendum are considered more appropriate for characterization of plume evolution, plume behavior, plume area, and dissolved arsenic occurrence within groundwater for purposes of the Nature and Extent evaluation. Conventional contour maps remain useful for evaluating conditions during individual monitoring periods; however, the GWSDAT approach provides a more comprehensive assessment of long-term plume geometry and temporal behavior within the uppermost aquifer[4].

5.2 Arsenic Plume Delineation

The arsenic plume was delineated using a ten-year groundwater monitoring dataset spanning the fourth quarter of 2016 through the third quarter of 2026, including analytical data from the AOR monitoring wells. The interpretation is based on groundwater monitoring results, hydrogeologic interpretations, potentiometric surface evaluations, and GWSDAT-generated concentration surfaces. A plume map was generated in GWSDAT for each annual evaluation period and is presented in Appendix F.

Figure 5 updates and supersedes the arsenic plume depiction in the September 2025 *Nature and Extent Report* by incorporating groundwater monitoring data collected pursuant to the AOR. It represents the current interpretation of arsenic distribution within the uppermost aquifer.

5.2.1 Horizontal Extent

The plume maps indicate that arsenic impacts remain concentrated north and northwest of the Dallman Ash Pond and are primarily associated with groundwater within the basal

[4] Jones, W.R., Spence, M.J., Bowman, A.W., Evers, L., and Molinari, D.A. (2014). "A software tool for the spatiotemporal analysis and reporting of groundwater monitoring data." *Environmental Modelling & Software*, 55, 242-249; Evers, L., Molinari, D.A., Bowman, A.W., Jones, W.R., and Spence, M.J. (2015). "Efficient and automatic methods for flexible regression on spatiotemporal data, with applications to groundwater monitoring." *Environmetrics*, 26, 431-441.

sand/weathered-bedrock aquifer. Elevated arsenic concentrations continue to occur in monitoring wells immediately downgradient of the Dallman Ash Pond, including AW1 and RW3, with concentrations generally decreasing away from the source area. Additional AOR monitoring locations provide improved control on the plume margins and greater confidence in the interpreted plume geometry.

The additional monitoring data refine plume boundaries and reduce uncertainty regarding the horizontal extent of arsenic impacts. The dataset does not indicate previously unrecognized, widespread arsenic impacts beyond the areas identified through previous assessments. The overall plume footprint displays temporal variability but remains generally consistent with the nature and extent described in the September 2025 *Nature and Extent Report*. Arsenic concentrations used to delineate the plume are summarized in Table 2. The highest concentrations continue to occur in RW3, AW1, AP8, P07D, and AW6, while many plume-margin and boundary wells remain below the groundwater protection standard. This distribution supports the interpretation of a localized plume centered within historically impacted portions of the basal sand/weathered-bedrock aquifer. The additional monitoring data also improve understanding of plume geometry relative to the shallow sand unit and former creek alignment and provide greater confidence in the interpreted lateral extent of groundwater impacts.

5.2.2 Vertical Extent

Groundwater impacts continue to be primarily associated with the basal sand/weathered bedrock interval, which represents the uppermost aquifer beneath the Site. Monitoring data collected from both historical and newly installed wells indicate that arsenic concentrations exceeding the groundwater protection standard are largely confined to this hydrostratigraphic interval. Vertical hydrostratigraphic relationships are illustrated on the geologic cross-sections in Appendix D and the conceptual site model in Figure 3.

The additional investigation supports recognition of the shallow sand unit as a potential groundwater migration pathway where saturated and hydraulically connected conditions exist. However, the available monitoring data do not indicate that the shallow sand unit represents the dominant hydrostratigraphic interval controlling the currently defined arsenic plume. The principal groundwater impacts remain associated with the basal sand/weathered bedrock aquifer. The occurrence of arsenic impacts within this interval is consistent with the hydraulic communication discussed in Section 3.3 and supports the interpretation that groundwater impacts associated with the CCR units are expressed primarily within the basal sand/weathered-bedrock aquifer.

5.2.3 Downgradient Extent

The additional monitoring locations installed under the AOR improve delineation of the downgradient extent of arsenic impacts and reduce uncertainty in areas where monitoring coverage was previously limited. Groundwater flow interpretations continue to indicate movement

toward Sugar Creek and other local convergence areas, consistent with previous potentiometric surface evaluations. Groundwater flow directions are depicted on Figure 4.

Concentrations observed in the newly installed wells generally support the existing interpretation of plume migration. While individual monitoring locations provide additional spatial resolution and improve delineation of downgradient plume boundaries, the dataset does not indicate substantial expansion of arsenic impacts beyond areas previously identified through routine groundwater monitoring and assessment activities. The additional monitoring locations installed pursuant to the AOR provide improved delineation of downgradient plume boundaries and reduce uncertainty regarding the lateral extent of arsenic migration between previously existing monitoring locations.

5.2.4 Areas of Uncertainty

As with most groundwater investigations, uncertainty remains near the outer limits of the interpreted plume where groundwater monitoring locations are more widely spaced. Additional uncertainty is associated with localized hydrogeologic variability, particularly near the former creek alignment and discontinuous shallow sand deposits identified during the AOR investigation. Interpretation of groundwater movement in the former creek corridor remains dependent upon correlation of heterogeneous alluvial and fill materials together with associated groundwater-bearing intervals, resulting in some uncertainty regarding the extent and continuity of hydraulic connectivity within this area. Similarly, the discontinuous nature of the shallow sand unit results in uncertainty regarding its relative contribution to groundwater migration at specific locations. These features may influence groundwater movement at a local scale and contribute to variability in concentration distributions. Potential migration pathways associated with the shallow sand unit and former creek alignment have been incorporated into the conceptual site model shown on Figure 3 and will continue to be evaluated as additional groundwater monitoring data become available. Although uncertainty remains regarding the relative significance of these features to plume development, incorporation of the AOR data has improved understanding of their potential role in groundwater migration and contaminant transport.

Although these uncertainties affect interpretation of localized groundwater flow paths, they do not materially alter the overall understanding of arsenic occurrence within the uppermost aquifer. The expanded monitoring network substantially improves confidence in plume delineation compared to previous evaluations.

The AOR investigation improves delineation of plume boundaries, reduces uncertainty regarding plume geometry, and provides additional information regarding groundwater migration pathways and hydraulic communication between CCR source areas and the uppermost aquifer. Incorporation of the additional monitoring locations into the GWSDAT evaluation resulted in refinement of plume contours, plume metrics, and the conceptual site model used to characterize groundwater impacts. The evaluation confirms that arsenic impacts remain primarily associated

with groundwater within the basal sand/weathered-bedrock aquifer and that the overall plume configuration displays some temporal variability generally consistent with interpretations presented in the September 2025 *Nature and Extent Report*. Refinements resulting from the AOR investigation improve confidence in characterization of the nature and extent of the arsenic release and address EPA comments regarding plume delineation, migration pathways, and hydraulic communication.

6. REVISED ARSENIC RELEASE CHARACTERIZATION

6.1 Previous Characterization

The September 2025 *Nature and Extent Report* concluded that arsenic impacts associated with the CCR surface impoundments were primarily present within the basal sand/weathered bedrock interval that comprises the uppermost aquifer beneath the Site. Arsenic concentrations exceeding the groundwater protection standard were identified in monitoring wells AW1, RW3, AP7, and AP8, and the nature and extent evaluation was based on groundwater monitoring data available through the fourth quarter of 2024.

The 2025 report interpreted groundwater flow as generally converging toward Sugar Creek and concluded that the arsenic plume was localized and associated with groundwater occurring near the unconsolidated soil/bedrock interface. Delineation of arsenic impacts relied on the existing monitoring network and geologic cross-sections developed from available borings and monitoring wells. The report further concluded that arsenic impacts could be adequately bounded by the existing monitoring network and associated assessment wells.

The hydrogeologic conceptual model presented in the 2025 report emphasized groundwater migration within the basal sand aquifer and did not identify the shallow sand unit or former creek alignment as significant contaminant migration pathways. At that time, available information was considered insufficient to support interpretation of either feature as an important component of the groundwater flow system responsible for arsenic transport.

The 2025 report also concluded that arsenic impacts were primarily associated with groundwater immediately downgradient of the Dallman Ash Pond and that the overall nature and extent of the release had been adequately characterized for purposes of the nature and extent determination.

The September 2025 characterization was developed prior to completion of the AOR investigation and, therefore, did not benefit from the additional hydrogeologic, groundwater quality, and groundwater elevation information subsequently obtained from the expanded monitoring network.

The September 2025 *Nature and Extent Report* also included estimates of dissolved arsenic occurrence based on analytical results collected from porewater monitoring locations installed

within the Dallman Ash Pond and Lakeside Ash Pond CCR units. Dissolved arsenic mass was estimated using measured porewater concentrations together with estimated porewater volumes for the CCR impoundments. The evaluation estimated approximately 43.2 kilograms of dissolved arsenic within Dallman Ash Pond porewater and approximately 20.1 kilograms of dissolved arsenic within Lakeside Ash Pond porewater, for a combined estimated dissolved arsenic mass of approximately 63.3 kilograms within CCR porewater.

These estimates were developed to characterize dissolved arsenic occurrence within the CCR impoundments themselves and were not intended to represent dissolved arsenic mass within groundwater. The September 2025 evaluation therefore focused on arsenic present within impoundment porewater, whereas the updated evaluation presented in this Addendum focuses on dissolved arsenic occurrence within the groundwater plume as delineated using GWSDAT and the expanded groundwater monitoring dataset. Consequently, the mass estimates developed in the September 2025 *Nature and Extent Report* and this Addendum are based on different media, different volumetric assumptions, and different calculation methodologies and are not directly comparable. The September 2025 estimate characterized dissolved arsenic occurrence within CCR impoundment porewater, whereas the present evaluation characterizes dissolved arsenic occurrence within groundwater and, therefore, addresses a different component of the overall arsenic release system.

6.2 Impact of New Information

Additional information obtained through the Agreement to Resolve (AOR) investigation was evaluated to determine whether the new data materially change the characterization of arsenic releases presented in the September 2025 *Nature and Extent Report*. The evaluation included additional borings, monitoring wells, groundwater quality data, groundwater elevation measurements, hydrogeologic interpretations, and GWSDAT plume analyses**.** The AOR investigation refined understanding of groundwater migration pathways, hydraulic communication, and plume geometry while continuing to support the conclusion that arsenic impacts remain primarily associated with groundwater within the basal sand/weathered-bedrock aquifer.

In addition, the AOR investigation provided the information necessary to estimate dissolved arsenic occurrence within the groundwater plume using GWSDAT-derived plume geometry and the expanded groundwater monitoring dataset. This updated evaluation supplements the porewater-based arsenic mass estimates, rather than replacing them, presented in the September 2025 *Nature and Extent Report* by providing a separate estimate of dissolved arsenic occurrence within groundwater.

The evaluation considered how the additional information affects understanding of groundwater migration pathways, hydraulic communication between the CCR units and the uppermost aquifer, plume geometry, and the characterization of arsenic releases.

6.2.1 Shallow Sand Pathway

The additional investigation supports recognition of the shallow sand unit as a potential groundwater migration pathway where saturated conditions and hydraulic continuity exist. Review of boring logs, cross-sections, and hydrostratigraphic mapping indicates that the shallow sand unit is present in localized areas and may provide a mechanism for groundwater movement within portions of the Site.

However, the shallow sand unit remains limited in thickness and lateral extent and does not appear to form a laterally continuous groundwater-bearing unit across the Site. The additional information refines the understanding of groundwater migration pathways and supports incorporation of the shallow sand unit into the conceptual site model as a potential groundwater migration pathway. However, the available monitoring data do not indicate that groundwater movement within the shallow sand unit alone controls the observed arsenic plume.

The AOR investigation and hydrogeologic evaluation support recognition of the shallow sand unit as a potential groundwater migration pathway where saturated and hydraulically connected conditions exist. This revised interpretation addresses the EPA's previous comments regarding the hydraulic significance of the shallow sand unit while recognizing that the unit remains discontinuous and limited in lateral extent across much of the Site.

6.2.2 Former Creek Alignment

The AOR investigation also provided additional information regarding the former creek alignment along the eastern side of the Dallman Ash Pond. Historical borings, recent borings, geologic cross-sections, and hydrostratigraphic mapping collectively indicate that portions of the former creek channel contain soft alluvial and fill materials associated with adjacent groundwater-bearing intervals and saturated sand deposits capable of facilitating groundwater movement.

Review of boring logs P-1D, P-2D, B-4, and B-8U indicates that the clay/fill intervals cited in EPA comments were generally logged as moist or wet rather than saturated. Saturated conditions were more commonly identified in underlying sand units and groundwater-bearing intervals. Consequently, the boring logs do not independently support characterization of the clay/fill materials themselves as uniformly saturated deposits. However, the boring logs do indicate the presence of soft alluvial and fill materials and localized groundwater-bearing zones that may influence groundwater movement along portions of the former creek alignment.

The former creek alignment, together with the shallow sand unit and long-term downward migration through lower-permeability deposits, represents one of several mechanisms that may contribute to migration of arsenic from the CCR source area to the basal sand/weathered bedrock aquifer.

These data support interpretation of portions of the former creek alignment as potential localized preferential groundwater migration pathways that may influence groundwater flow and contaminant transport incorporated into the conceptual site model. However, available information does not indicate that the former creek channel forms a continuous conduit beneath the Site or represents the sole mechanism by which arsenic has migrated from the CCR source area to the uppermost aquifer. Rather, the former creek alignment is interpreted as one of several hydrogeologic features that may influence local groundwater movement and contaminant transport.

6.2.3 Additional Monitoring Wells

The installation of monitoring wells AW4, AW5, AW6, and AP17 improved groundwater monitoring coverage in areas where additional data were previously needed. Analytical results from these wells provide improved spatial definition of arsenic concentrations and increase confidence in interpretation of plume boundaries.

The new monitoring results generally confirm the previously interpreted distribution of arsenic impacts while improving delineation of plume boundaries, reducing uncertainty regarding plume geometry, and providing additional information relevant to groundwater migration pathways and hydraulic communication. While the new wells provide important information regarding plume geometry and local groundwater conditions, they do not identify a previously unrecognized plume segment or indicate substantial expansion of the arsenic plume beyond areas already identified in the September 2025 *Nature and Extent Report*. Analytical results from the AOR monitoring wells are summarized in Table 2 and were incorporated into the plume delineation, hydrogeologic interpretation, and arsenic release calculations presented in this Addendum.

6.2.4 Plume Delineation

Incorporation of the AOR monitoring data into the GWSDAT evaluation resulted in refinement of plume contours and associated plume metrics. The analysis improves delineation of the horizontal extent of impacts and provides greater confidence in estimates of plume area, average concentration, and dissolved arsenic mass. The evolution of the plume geometry is illustrated on the GWSDAT figures in Appendix F.

The plume interpretation confirms that arsenic impacts remain concentrated within the basal sand/weathered bedrock aquifer and remain generally consistent with the plume configuration previously identified. The revised plume maps reflect improved delineation resulting from

additional monitoring data and provide a more robust characterization of plume geometry and groundwater impacts. The additional monitoring data improve confidence in plume geometry, reduce uncertainty regarding plume margins, and provides additional resolution of groundwater conditions between previously existing monitoring locations.

Collectively, the new information supports refinement of the hydrogeologic conceptual model by recognizing the shallow sand unit and portions of the former creek alignment as potential groundwater migration pathways and hydrogeologic features that may contribute to migration of arsenic from the CCR source areas to the uppermost aquifer. However, the additional investigation does not fundamentally alter the interpretation that arsenic impacts are primarily associated with groundwater within the basal sand/weathered-bedrock aquifer, nor do they substantially change the overall nature and extent of the arsenic release.

The additional investigation refines understanding of groundwater migration pathways, improves delineation of arsenic impacts, and enhance characterization of hydraulic communication between the CCR source areas and the uppermost aquifer. The updated conceptual site model recognizes that arsenic migration to the basal sand/weathered-bedrock aquifer likely reflects a combination of long-term downward migration through lower-permeability deposits under sustained hydraulic gradients and potential localized migration through hydrogeologic features such as the shallow sand unit and portions of the former creek alignment where favorable hydraulic conditions exist.

The AOR investigation also provided sufficient groundwater monitoring data to characterize the occurrence of dissolved arsenic within the groundwater plume using GWSDAT. Whereas the September 2025 *Nature and Extent Report* estimated the occurrence of dissolved arsenic within CCR impoundment porewater, the updated evaluation estimates the occurrence of dissolved arsenic within groundwater. These calculations address different portions of the overall arsenic release system and, therefore, provide complementary, rather than directly comparable, estimates of dissolved arsenic occurrence.

While the additional investigation substantially improves understanding of groundwater migration pathways, plume geometry, and dissolved arsenic occurrence within groundwater, arsenic impacts remain primarily associated with the basal sand/weathered-bedrock aquifer and the overall nature and extent of the arsenic release remain generally consistent with the interpretation presented in the September 2025 *Nature and Extent Report*.

7. ARSENIC RELEASE CALCULATIONS

7.1 Methodology

The September 2025 *Nature and Extent Report* estimated arsenic release quantities using groundwater monitoring data available at that time and the interpreted extent of groundwater impacts within the uppermost aquifer. Since completion of that evaluation, additional monitoring locations have been installed pursuant to the AOR, providing improved spatial coverage and better definition of plume geometry.

Groundwater arsenic concentrations were evaluated using the GWSDAT, an open-source decision-support tool developed for analysis and visualization of groundwater monitoring data. GWSDAT applies a spatiotemporal statistical model that evaluates groundwater concentration data as a function of both location (X-Y coordinates) and time, allowing concentration trends and plume geometry to be interpreted simultaneously rather than through independent spatial or temporal analyses (Jones, W.R., et al., 2014; Evers, L, et al., 2015). GWSDAT utilizes non-parametric smoothing and spatiotemporal regression techniques to generate continuous groundwater concentration surfaces from discrete monitoring well data.

For this evaluation, total arsenic concentration data collected between the fourth quarter of 2016 and the third quarter of 2026 were imported together with monitoring well coordinates and groundwater elevation information. The dataset included both historical monitoring locations and monitoring wells installed pursuant to the AOR (AW-4, AW-5, AW-6, and AP-17). GWSDAT used the monitoring data to fit a spatiotemporal concentration surface representing arsenic occurrence within the uppermost aquifer for each evaluation period.

Although the spatiotemporal model was fit using quarterly data, plume characterization was performed using annual aggregation of the modeled concentration surfaces to provide a stable representation of long-term groundwater conditions and incorporate the complete AOR monitoring dataset.

The resulting concentration surfaces were used to generate yearly plume maps by interpolating arsenic concentrations between monitoring wells while accounting for temporal trends in the groundwater dataset. Plume boundaries were defined using an arsenic threshold concentration of 23.9 micrograms per liter (µg/L), corresponding to the arsenic groundwater protection standard (GWPS). Areas where the interpolated concentration surface exceeded the selected threshold were delineated as the arsenic plume. GWSDAT then calculated plume metrics including plume area, average plume concentration, and normalized dissolved plume mass. Annual periods that did not produce a closed plume geometry were evaluated qualitatively through review of the modeled concentration surfaces but were not used for quantitative plume-area or plume-mass calculations.

GWSDAT plume statistics were calculated using an effective porosity of 43 percent. The selected porosity value is based on published saturation water-content data for sandy materials reported by Sharp-Hansen et al.[5], which indicate a representative range of approximately 37 to 49 percent. The mean value of 43 percent was adopted as representative of the basal sand/weathered-bedrock aquifer for purposes of plume metric evaluation and dissolved arsenic mass estimation.

To estimate total dissolved arsenic mass within groundwater, the normalized GWSDAT plume mass was multiplied by a representative saturated thickness for the basal sand/weathered-bedrock aquifer. Based on hydrogeologic information presented in the September 2025 *Flow Path Report* and subsequent AOR investigation, a representative saturated thickness of approximately 12 feet was selected for mass estimation. This thickness is considered representative of the arsenic-bearing portion of the uppermost aquifer and provides a reasonable basis for order-of-magnitude estimation of dissolved arsenic mass.

The evaluation is intended to refine previous estimates using the expanded monitoring dataset and the revised conceptual understanding developed through the AOR investigation. The calculations reflect improved characterization of plume geometry, groundwater migration pathways, and concentration distributions resulting from incorporation of additional monitoring data rather than a fundamental change in the overall interpretation of groundwater impacts. Supporting GWSDAT output files are provided in Appendix F.

7.1.1 GWSDAT Model Assumptions

The GWSDAT evaluation is based on several assumptions regarding data treatment, statistical modeling, and plume characterization. These assumptions were selected to provide a consistent and reproducible framework for evaluating arsenic occurrence within the uppermost aquifer.

Key assumptions incorporated into the GWSDAT evaluation include:

- Groundwater concentration data are representative of groundwater quality conditions at the corresponding monitoring well locations and sampling dates.
- Arsenic concentrations can be reasonably represented using a spatiotemporal smoothing model that evaluates concentration as a function of both location and time.
- The groundwater monitoring network provides sufficient spatial and temporal coverage to characterize plume geometry and concentration distributions within the uppermost aquifer.

[5] Sharp-Hansen, S., Travers, C., Hummel, P., and Allison, T. (1990). *A Subtitle D Landfill Application Manual for the Multimedia Exposure Assessment Model (MULTIMED)*. U.S. EPA Environmental Research Laboratory, Athens, Georgia. EPA Contract No. 68-03-3513.

- Quarterly monitoring data provide an appropriate basis for fitting the spatiotemporal model, while annual aggregation of the modeled concentration surfaces provides a representative characterization of long-term plume behavior.
- Non-detect analytical results were assigned a value equal to one-half of the laboratory reporting limit prior to model fitting.
- Groundwater elevations were aggregated using the median groundwater elevation value for each evaluation period.
- A penalized spline (PSpline) smoothing model using eight spline segments and higher-resolution model output settings was used to generate concentration surfaces.
- The arsenic groundwater protection standard (23.9 µg/L) was used as the plume delineation threshold concentration.
- Plume metrics were calculated only for annual periods in which the selected threshold concentration produced a statistically valid closed plume geometry.
- An effective porosity of 43 percent was assumed for the basal sand/weathered-bedrock aquifer.
- A representative saturated thickness of 12 feet was assumed for calculation of estimated dissolved arsenic mass from the normalized plume mass reported by GWSDAT.

These assumptions are consistent with the objectives of the Nature and Extent evaluation and provide a transparent basis for interpretation of plume geometry, plume area, average plume concentration, and estimated dissolved arsenic mass.

7.2 Results

The GWSDAT evaluation generated quantitative plume metrics for arsenic using historical groundwater monitoring data together with results from the newly installed monitoring wells. The plume statistics provide a consistent quantitative basis for evaluating changes in plume geometry, plume extent, and dissolved arsenic mass through time. GWSDAT-derived plume metrics are shown on the figures in Appendix F.

The GWSDAT plume statistics are based on a groundwater monitoring dataset spanning approximately ten years (Fourth Quarter 2016 through Third Quarter 2026) and, therefore, represent a robust characterization of arsenic occurrence within the uppermost aquifer. The resulting plume geometry and dissolved mass estimates are considered representative of long-term groundwater conditions rather than short-term fluctuations associated with individual monitoring events.

Arsenic plume metrics include:

- Estimated plume area above the 23.9 µg/L arsenic groundwater protection standard (GWPS);
- Average arsenic concentration within the delineated plume; and
- Estimated dissolved arsenic mass within the plume.

Annual GWSDAT plume maps were generated for ten consecutive annual monitoring periods spanning the fourth quarter of 2016 through the third quarter of 2026 using an arsenic threshold concentration equal to the groundwater protection standard (23.9 µg/L). Plume statistics could only be calculated for annual periods in which the threshold concentration produced a statistically valid closed plume geometry. During the first four annual periods (2016-2017 through 2019-2020), the 23.9 µg/L contour did not produce a closed plume and plume area and plume mass could not be reliably calculated. Beginning with the 2020-2021 evaluation period, a closed plume geometry was produced and GWSDAT calculated annual plume metrics. The largest annual plume metrics were observed during the 2022-2023 evaluation period, when the normalized dissolved plume mass was approximately 1.07 kg/ft and the plume area was approximately 1.51 million square feet. Thereafter, both plume area and normalized plume mass declined, with the 2025-2026 evaluation period producing a normalized dissolved plume mass of approximately 0.189 kg/ft and a plume area of approximately 496,260 square feet. The decrease in calculated plume area and normalized plume mass during the most recent evaluation periods is consistent with a reduction in the portion of the aquifer exceeding the groundwater protection standard and is consistent with the interpretation that groundwater impacts remain localized within historically affected portions of the basal sand/weathered-bedrock aquifer.

As indicated above, the arsenic plume area for the 2025-2026 evaluation period is approximately 496,260 square feet (11.39 acres) using a threshold concentration of 23.9 µg/L and an effective porosity of 43 percent. GWSDAT calculated a normalized dissolved plume mass of approximately 0.189 kg/ft. Because GWSDAT reports plume mass normalized to saturated aquifer thickness, a representative saturated thickness of 12 feet was applied to estimate total dissolved arsenic mass within groundwater. Application of this representative saturated thickness yields an estimated dissolved arsenic mass of approximately 2.3 kilograms within the delineated plume. This value should be considered an order-of-magnitude estimate because actual saturated thickness varies across the plume area and the normalized plume mass reported by GWSDAT is the direct model output.

These metrics were calculated from a groundwater monitoring dataset spanning approximately ten years (Fourth Quarter 2016 through Third Quarter 2026) and incorporating both historical monitoring locations and wells installed pursuant to the Agreement to Resolve. The resulting plume metrics therefore reflect long-term groundwater conditions and arsenic occurrence within

the uppermost aquifer rather than short-term fluctuations associated with individual monitoring events. The delineated plume remains concentrated within historically impacted portions of the basal sand/weathered-bedrock aquifer and does not indicate substantial expansion beyond previously identified plume boundaries.

The evaluation indicates that the arsenic plume remains relatively localized and that variations in calculated plume metrics generally correspond to differences in plume delineation, monitoring density, interpolation, and incorporation of additional monitoring locations rather than evidence of substantial changes in plume behavior. GWSDAT results provide improved confidence in characterization of plume geometry and dissolved arsenic distribution within the uppermost aquifer. The inclusion of AOR monitoring locations improved resolution of plume margins and reduced uncertainty associated with previous plume boundary interpretations.

Annual GWSDAT plume statistics that could be calculated at the 23.9 µg/L threshold indicate that plume area and normalized plume mass were greatest during the 2020-2023 evaluation period and subsequently decreased through the most recent evaluation period (2025-2026). The decrease in both plume area and normalized plume mass suggests that groundwater exceeding the groundwater protection standard remains concentrated within historically impacted portions of the uppermost aquifer and does not indicate continuing plume expansion.

Detailed GWSDAT output figures and supporting information are included in Appendix F.

7.2.1 Comparison with 2025 Estimates

The September 2025 *Nature and Extent Report* characterized arsenic occurrence using groundwater monitoring data available through the fourth quarter of 2024 together with estimates of dissolved arsenic present within CCR impoundment porewater. Since completion of that evaluation, additional monitoring wells have been installed pursuant to the Agreement to Resolve (AOR), resulting in increased spatial coverage of groundwater conditions and arsenic concentrations surrounding the Dallman Ash Pond and Lakeside Ash Pond.

The GWSDAT evaluation completed for this Addendum incorporated approximately ten years of groundwater monitoring data spanning the period from the fourth quarter of 2016 through the third quarter of 2026. The expanded dataset provides a more robust basis for evaluating arsenic plume geometry, concentration distributions, and dissolved arsenic occurrence within groundwater than was available during preparation of the September 2025 report.

The additional monitoring locations installed under the AOR improved delineation of plume boundaries and reduced uncertainty regarding groundwater conditions in areas previously characterized by limited monitoring data. Incorporation of these locations into the GWSDAT

evaluation refined interpretation of plume geometry and improved understanding of groundwater migration pathways represented in the updated conceptual site model.

It should be noted that the arsenic mass estimates presented in the September 2025 *Nature and Extent Report* and this Addendum are based on different calculation approaches and are, therefore, not directly comparable. The September 2025 *Nature and Extent Report* estimated arsenic mass within CCR impoundment porewater using porewater concentrations and estimated porewater volumes. In contrast, this Addendum estimates arsenic occurrence within the groundwater plume using GWSDAT-derived plume geometry, groundwater concentrations, an assumed effective porosity of 43 percent, and a representative saturated aquifer thickness of 12 feet. Consequently, differences between the reported mass estimates reflect differences in the media evaluated and calculation methodology in addition to incorporation of new groundwater monitoring data. The September 2025 calculations characterized dissolved arsenic occurrence within the CCR units themselves, whereas the present evaluation characterizes dissolved arsenic occurrence within groundwater downgradient of the CCR units.

Annual plume statistics generated by GWSDAT provide additional insight into the temporal behavior of the arsenic plume. Closed plume geometries could not be delineated during the first four annual evaluation periods using the groundwater protection standard threshold concentration of 23.9 µg/L. However, statistically valid closed plume geometries were generated during the 2020-2021, 2021-2022, 2022-2023, 2024-2025, and 2025-2026 evaluation periods. The calculated plume areas ranged from approximately 496,260 square feet to approximately 1.52 million square feet, while normalized dissolved plume mass ranged from approximately 0.189 kg/ft to approximately 1.07 kg/ft. The reduction in both plume area and normalized plume mass observed during the most recent annual evaluation period suggests that arsenic impacts exceeding the groundwater protection standard remain concentrated within historically impacted areas and do not indicate continuing plume expansion.

GWSDAT identified a plume area of approximately 496,260 square feet (11.39 acres) and a normalized dissolved plume mass of approximately 0.189 kg/ft for the 2025-2026 evaluation period. Application of a representative saturated thickness of 12 feet yields an estimated dissolved arsenic mass of approximately 2.3 kilograms within the delineated groundwater plume. The resulting plume metrics indicate that arsenic impacts remain concentrated within historically affected portions of the basal sand/weathered-bedrock aquifer and do not indicate substantial expansion of the plume footprint beyond previously identified areas of impact. The estimated groundwater-plume mass is therefore best interpreted as a refinement of groundwater release characterization rather than evidence of a significant change in plume behavior.

Overall, the updated evaluation supports refinement of arsenic release characterization rather than a fundamental change in understanding of the nature and extent of groundwater impacts. The expanded monitoring network, updated hydrogeologic interpretation, and GWSDAT analyses

provide improved confidence in characterization of plume geometry, groundwater migration pathways, hydraulic communication, and dissolved arsenic occurrence within the uppermost aquifer.

8. CONCLUSIONS

The investigation completed pursuant to the Agreement to Resolve (AOR) has provided additional groundwater monitoring and hydrogeologic information that improves the understanding of groundwater conditions surrounding the Dallman Ash Pond (DAP) and Lakeside Ash Pond (LAP) CCR units. The additional data have been incorporated into the conceptual site model, groundwater flow interpretation, arsenic plume delineation, and arsenic release calculations presented in this Addendum.

The AOR investigation does not fundamentally alter the conclusions regarding the primary occurrence of arsenic within the basal sand/weathered bedrock aquifer presented in the June 2025 *Nature and Extent Report*. Rather, the expanded dataset provides additional spatial control, reduces uncertainty regarding plume configuration and migration pathways, and refines the hydrogeologic conceptual site model presented in the September 2025 *Flow Path Report* and June 2025 *Nature and Extent Report*. The AOR investigation provided additional information regarding the shallow sand unit, former creek alignment, and groundwater conditions in areas where monitoring data were previously limited. Evaluation of these data supports recognition of the shallow sand unit as a potential groundwater migration pathway where saturated and hydraulically connected conditions exist. However, the shallow sand unit remains limited in areal extent and does not form a laterally continuous groundwater-bearing unit beneath or surrounding the CCR units. As a result, any contribution of the shallow sand unit to groundwater migration is interpreted to be localized rather than sitewide. Similarly, portions of the former creek alignment may function as potential localized groundwater flow and preferential migration pathways where permeable alluvial materials remain present. Review of historical and recent boring logs indicates that clay/fill intervals within portions of the former creek corridor were generally logged as moist or wet rather than saturated; however, groundwater-bearing sands and localized hydraulically conductive materials remain present and may contribute to groundwater migration within the corridor.

Groundwater monitoring data continues to demonstrate the presence of arsenic within the basal sand/weathered bedrock aquifer. The occurrence of groundwater impacts within this hydrostratigraphic interval supports the conclusion that hydraulic communication exists between the CCR source areas and the uppermost aquifer. The available data support a conceptual model in which arsenic migration to the basal sand/weathered bedrock aquifer is likely associated with long-term downward migration under sustained hydraulic gradients associated with decades of CCR management activities, potentially enhanced by localized migration through hydrogeologic features such as the shallow sand unit and portions of the former creek alignment where favorable

hydraulic conditions exist. The available information does not identify a single discrete pathway responsible for all observed groundwater impacts.

The installation of monitoring wells AW4, AW5, AW6, and AP17 improved groundwater monitoring coverage and increased confidence in interpretation of groundwater quality conditions surrounding the DAP. These locations provide additional spatial control on arsenic concentrations, improve delineation of plume boundaries, and reduce uncertainty in plume geometry, resulting in a more robust interpretation of groundwater impacts as summarized in Table 2.

GWSDAT analyses and resulting plume metrics (Appendix F), which incorporate both historical groundwater data and AOR monitoring results, provide improved delineation of arsenic plume boundaries and estimates of plume area, average concentration, and dissolved arsenic mass. The revised plume interpretation confirms that arsenic impacts remain primarily associated with groundwater within the basal sand/weathered bedrock aquifer and that overall plume geometry remains generally consistent with historical groundwater monitoring observations, although temporal variability is evident in plume area, concentration distributions, and normalized dissolved plume mass. Incorporation of the AOR monitoring locations improved delineation of plume boundaries, reduced uncertainty regarding plume geometry, and enhanced understanding of groundwater migration pathways represented in the conceptual site model. A closed plume geometry exceeding the GWPS was present during the 2020-2023 and 2024-2026 evaluation periods, but both plume area and normalized plume mass declined substantially between 2022-2023 and 2025-2026. The most recent annual plume area (496,260 ft²) represents approximately one-third of the maximum plume area calculated during the monitoring period, while the normalized plume mass decreased from approximately 1.07 kg/ft to approximately 0.19 kg/ft. These results indicate that arsenic impacts remain localized and do not demonstrate continued expansion of the plume beyond historically impacted portions of the uppermost aquifer. These results support the interpretation that arsenic impacts remain primarily associated with groundwater within the basal sand/weathered-bedrock aquifer and provide an updated quantitative estimate of dissolved arsenic occurrence within the uppermost aquifer. This estimate should be considered an order-of-magnitude approximation because actual saturated thickness varies spatially throughout the plume area and the GWSDAT output is not intended to represent a direct calculation of total dissolved mass. Instead, the estimate provides a reasonable basis for comparing the magnitude of dissolved arsenic present within the uppermost aquifer and addressing EPA's request for arsenic release calculations.

These results support the interpretation that arsenic impacts remain concentrated within historically affected portions of the uppermost aquifer and do not indicate substantial expansion of the plume footprint. Long-term groundwater elevation data indicate that a groundwater flow associated with the FGDS Development Unit 2 area induces localized flow convergence, while Sugar Creek functions as a groundwater discharge feature that exerts hydraulic influence along portions of the northern and western site boundaries. Collectively, these features likely contribute

to the localized nature of the arsenic plume and help explain the persistence of elevated concentrations within historically impacted areas despite the absence of substantial plume expansion.

The additional investigation and analyses refine understanding of groundwater migration pathways, improve characterization of hydraulic communication between the CCR source area and the uppermost aquifer, and enhance delineation of the arsenic plume. However, the new information does not substantially alter the overall interpretation of the nature and extent of arsenic impacts presented in the September 2025 *Nature and Extent Report*. Rather, the evaluation provides improved delineation of groundwater impacts and greater confidence in plume characterization through incorporation of additional monitoring locations and hydrogeologic information.

Finally, revisions to arsenic release calculations presented in this Addendum are primarily attributable to improved plume delineation resulting from the expanded monitoring network and incorporation of groundwater monitoring data collected pursuant to the AOR. The calculations provide a more complete representation of plume geometry and concentration distribution and improve confidence in quantitative characterization of the arsenic release.

Accordingly, the additional investigation completed pursuant to the Agreement to Resolve refines the hydrogeologic conceptual site model, improves delineation of arsenic impacts, and enhances understanding of groundwater migration pathways and hydraulic communication between the CCR source areas and the uppermost aquifer. The conceptual site model recognizes that arsenic migration to the basal sand/weathered-bedrock aquifer likely reflects a combination of long-term downward migration through lower-permeability deposits under sustained hydraulic gradients and potential migration through hydrogeologic features such as the shallow sand unit and portions of the former creek alignment where favorable hydraulic conditions exist. While the results of the AOR investigation substantially improve understanding of groundwater conditions and reduce uncertainty regarding plume geometry and migration pathways, groundwater impacts remain primarily associated with the basal sand/weathered-bedrock aquifer and the overall nature and extent of the arsenic release remain generally consistent with the interpretation presented in the September 2025 *Nature and Extent Report*. The information presented in this addendum represents refinements to existing interpretations and directly addresses EPA comments regarding plume delineation, groundwater migration pathways, hydraulic communication, and characterization of the arsenic release.

ANNULAR SPACE DETAILS

Type of surface seal: Concrete

Type of annular sealant: Bentonite Grout

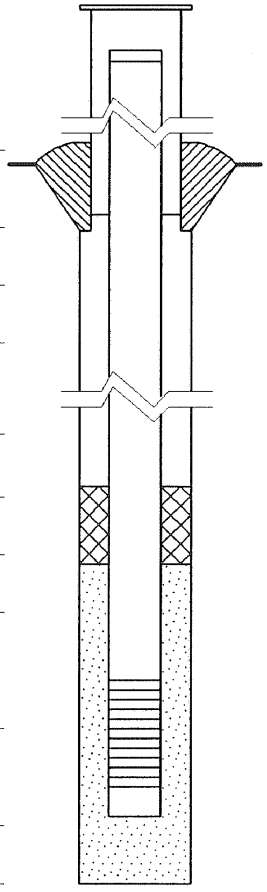
Installation method: Tremie Pipe

Setting time: 24+ Hours

Type of bentonite seal: Bentonite Pellets

Installation method: Free drop

Setting time: 30+ minutes



Type of sand pack: Quartz Sand

Grain size: 20/40 (sieve size)

Installation method: Free drop

Type of backfill material: Quartz Sand (if applicable)

Installation method: Free drop

RE: Ash Pond Monitoring Wells **WorkOrder:** 25110404

Dear Eric Staley:

TEKLAB, INC received 22 samples on 11/13/2025 4:30:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 25110404
Client Project: Ash Pond Monitoring Wells
Report Date: 13-Jan-26

Qualifiers

# - Unknown hydrocarbon	B - Analyte detected in associated Method Blank
C - RL shown is a Client Requested Quantitation Limit	E - Value above quantitation range
H - Holding times exceeded	I - Associated internal standard was outside method criteria
J - Analyte detected below quantitation limits	M - Manual Integration used to determine area response
ND - Not Detected at the Reporting Limit	R - RPD outside accepted recovery limits
S - Spike Recovery outside recovery limits	T - TIC(Tentatively identified compound)
X - Value exceeds Maximum Contaminant Level	

Case Narrative

RE: 25110404

Dear Shelly Hennessy:

Order No.: 25111579

Alliance Technical Group - Akron received 22 sample(s) on 11/19/2025 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **25111579**
Date: **1/8/2026**

CLIENT: TEKLAB Inc,
Project: 25110404

WorkOrder Narrative:
25111579: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Alliance Technical Group Work Order Number assigned to this report.

Alliance Technical Group holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Alliance Technical Group and that of the customer. It cannot be reproduced in any form without the consent of Alliance Technical Group or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Alliance Technical Group is not responsible for use or interpretation of the data included herein.

All results for solid samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence Sample Notes:
25111579-009A Radium-228_NPW(904.0): Parent sample and duplicate exhibit a high RPD, most likely caused by sample matrix.
25111579-010A Radium-226_NPW(903.0): Parent sample and dup exhibit high RPD, both results are below the PQL.

Analytical Sequence QC Notes:
LCS/LCSD-90886 Radium-228_DW(904.0): LCS and LCSD exhibited high RPD. Both are within passing recovery criteria.

Qualifiers and Acronyms

WO#: **25111579**
Date: **1/8/2026**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: Ash Pond Monitoring Wells **WorkOrder:** 26020092

Dear Eric Staley:

TEKLAB, INC received 22 samples on 2/12/2026 1:26:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 26020092

Client Project: Ash Pond Monitoring Wells
Report Date: 27-Mar-26

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C 5.4
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice ☐
Chain of custody present?	Yes ☑	No ☐		
Chain of custody signed when relinquished and received?	Yes ☑	No ☐		
Chain of custody agrees with sample labels?	Yes ☑	No ☐		
Samples in proper container/bottle?	Yes ☑	No ☐		
Sample containers intact?	Yes ☑	No ☐		
Sufficient sample volume for indicated test?	Yes ☑	No ☐		
All samples received within holding time?	Yes ☑	No ☐		
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐		

When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.

Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑
Water - pH acceptable upon receipt?	Yes ☐	No ☑	NA ☐
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑

Any No responses must be detailed below or on the COC.

pH strip #104524. -DM/ lhenson - 2/12/2026 11:12:14 AM

Additional nitric acid (109168) was needed for AW-1 upon arrival at the laboratory. - DM/lhenson - 2/12/2026 11:12:23 AM

Additional cooler temperatures: 10.0C, 7.8C, 3C LTG#9. LH 2/12/26.

Samples were received on 2/12/26 at 1326 on ice [temp10.4C, 8.0C, 6.6C - LTG#9]. pH#104524 -DM/lhenson - 2/13/2026 8:29:59 AM

RE: 26020092

Dear Shelly Hennessy:

Order No.: 26021092

Alliance Technical Group - Akron received 22 sample(s) on 2/16/2026 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **26021092**
Date: **3/26/2026**

CLIENT: TEKLAB Inc,
Project: 26020092

WorkOrder Narrative:
26021092: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Alliance Technical Group Work Order Number assigned to this report.

Alliance Technical Group holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Alliance Technical Group and that of the customer. It cannot be reproduced in any form without the consent of Alliance Technical Group or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Alliance Technical Group is not responsible for use or interpretation of the data included herein.

All results for solid samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **26021092**
Date: **3/26/2026**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

7. Sample(s) in proper container(s)? Yes ☑ No ☐
8. Sufficient sample volume for indicated test(s)? Yes ☑ No ☐
9. Are samples (except VOA and ONG) properly preserved? Yes ☑ No ☐
10. Was preservative added to bottles? Yes ☐ No ☑ NA ☐
11. Is the headspace in the VOA vials less than 1/4 inch or 6 mm? Yes ☐ No ☐ No VOA Vials ☑
12. Were any sample containers received broken? Yes ☐ No ☑
13. Does paperwork match bottle labels? Yes ☑ No ☐
    (Note discrepancies on chain of custody)
14. Are matrices correctly identified on Chain of Custody? Yes ☑ No ☐
15. Is it clear what analyses were requested? Yes ☑ No ☐
16. Were all holding times able to be met? Yes ☑ No ☐
    (If no, notify customer for authorization.)

Special Handling (if applicable)

17. Was client notified of all discrepancies with this order? Yes ☐ No ☐ NA ☑

RE: FGDS Landfill **WorkOrder:** 26020093

Dear Eric Staley:

TEKLAB, INC received 5 samples on 2/12/2026 1:15:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

Report Contents

Client: City Water, Light & Power
Work Order: 26020093
Client Project: FGDS Landfill
Report Date: 12-Mar-26

This reporting package includes the following:

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	6
Laboratory Results	7
Receiving Check List	13
Chain of Custody	Appended

Client: City Water, Light & Power **Work Order:** 26020093

Client Project: FGDS Landfill **Report Date:** 12-Mar-26

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Definitions

Client: City Water, Light & Power
Work Order: 26020093
Client Project: FGDS Landfill
Report Date: 12-Mar-26

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Case Narrative

Client: City Water, Light & Power
Client Project: FGDS Landfill

Work Order: 26020093
Report Date: 12-Mar-26

Carrier: Brett Gillihan

Received By: LEH

Completed by: Laura E Henson
On: 12-Feb-26

Reviewed by: Amber Dilallo
On: 13-Feb-26

Pages to follow: Chain of custody 2 Extra pages included 23

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C 5.4
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice ☐
Chain of custody present?	Yes ☑	No ☐		
Chain of custody signed when relinquished and received?	Yes ☑	No ☐		
Chain of custody agrees with sample labels?	Yes ☑	No ☐		
Samples in proper container/bottle?	Yes ☑	No ☐		
Sample containers intact?	Yes ☑	No ☐		
Sufficient sample volume for indicated test?	Yes ☑	No ☐		
All samples received within holding time?	Yes ☑	No ☐		
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐		

When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.

Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑
Water - pH acceptable upon receipt?	Yes ☑	No ☐	NA ☐
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑

Any No responses must be detailed below or on the COC.

pH strip #104524. -JD/ lhenson - 2/12/2026 11:24:39 AM

Additional cooler temperatures: 10.0C, 7.8C, 3.4C. LTG#9. LH 2/12/26

Samples were received on 2/12/26 at 1315 on ice [temp10.4C, 8.0C, 6.6C - LTG#9]. pH#104524. - DM/lhenson - 2/13/2026 7:24:40 AM

RE: 26020093

Dear Shelly Hennessy: Order No.: 26021091

Alliance Technical Group - Akron received 5 sample(s) on 2/16/2026 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **26021091**
Date: **3/4/2026**

CLIENT: TEKLAB Inc,
Project: 26020093

WorkOrder Narrative:
26021091: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Alliance Technical Group Work Order Number assigned to this report.

Alliance Technical Group holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Alliance Technical Group and that of the customer. It cannot be reproduced in any form without the consent of Alliance Technical Group or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Alliance Technical Group is not responsible for use or interpretation of the data included herein.

All results for solid samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence Sample Notes:
26021091-001A Radium-228_DW(904.0): Sample result to be reported at client's request without confirmation due to limited volume.
26021091-003A Radium-228_DW(904.0): Sample result to be reported at client's request without confirmation due to limited volume.

Qualifiers and Acronyms

WO#: **26021091**
Date: **3/4/2026**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: Ash Pond Monitoring Wells **WorkOrder:** 26041298

Dear Eric Staley:

TEKLAB, INC received 22 samples on 4/23/2026 1:04:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Report Date: 22-May-26

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C 2.4
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice ☐
Chain of custody present?	Yes ☑	No ☐		
Chain of custody signed when relinquished and received?	Yes ☑	No ☐		
Chain of custody agrees with sample labels?	Yes ☑	No ☐		
Samples in proper container/bottle?	Yes ☑	No ☐		
Sample containers intact?	Yes ☑	No ☐		
Sufficient sample volume for indicated test?	Yes ☑	No ☐		
All samples received within holding time?	Yes ☑	No ☐		
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐		
When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.				
Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑	
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑	
Water - pH acceptable upon receipt?	Yes ☐	No ☑	NA ☐	
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑	

Any No responses must be detailed below or on the COC.

pH strip #104524. - lhenson - 4/22/2026 8:51:31 AM

Additional nitric acid (109879) was needed for T-04 and T-06 upon arrival at the laboratory. - lhenson - 4/22/2026 8:56:15 AM

Samples were received on 4/22/2026 at 14:57 on ice [10.4C, 13.6, 12.8 - LTG#9]. pH strip #104524. Additional nitric acid (109879) was needed for 2 of 3 1L AP10 and G120 upon arrival at the laboratory. - ekossakoski - 4/22/2026 4:03:50 PM

Samples were received on 4/23/2026 at 13:04 on ice [18.4C - LTG#9]. pH strip #104524. - CRS/ekossakoski - 4/23/2026 2:27:28 PM

RE: 26041298

Order No.: 26042100

Dear Shelly Hennessy:

Alliance Technical Group - Akron received 22 sample(s) on 4/27/2026 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **26042100**
Date: **5/17/2026**

CLIENT: TEKLAB Inc,
Project: 26041298

WorkOrder Narrative:
26042100: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Alliance Technical Group Work Order Number assigned to this report.

Alliance Technical Group holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Alliance Technical Group and that of the customer. It cannot be reproduced in any form without the consent of Alliance Technical Group or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Alliance Technical Group is not responsible for use or interpretation of the data included herein.

All results for solid samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence Sample Notes:
26042100-001A Radium-228_NPW(904.0): Parent sample and duplicate exhibit a high RPD, results are below reporting limit and do not need reanalysis.

Qualifiers and Acronyms

WO#: **26042100**
Date: **5/17/2026**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

Contact: Shelly Hennessy | Email: shennessy@TekLabInc.com

Requested Due Date: Standard TAT | Billing/PO: 40966 | Phone: (618) 344-1004 ext 1024

Comments: **Please Issue reports and invoices via email only**
SHIP to ATG-Akron. Please analyze for Radium 226/228 per 903/904 methods.
Any changes to analysis/methods must be approved by Teklab, Inc.
Batch QC and standard EDD are required. State of Sample Origin = IL

LOI
PH: 2, 2, 2
CPM: 24, 18, 22

In:
PH: 2, 2, 2
CPM: 25, 24, 24

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

RE: Landfill Monitoring Wells G1-G2-G3 **WorkOrder:** 26041297

Dear Eric Staley:

TEKLAB, INC received 13 samples on 4/23/2026 1:04:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 26041297

Client Project: Landfill Monitoring Wells G1-G2-G3
Report Date: 26-May-26

Qualifiers

- Unknown hydrocarbon
B - Analyte detected in associated Method Blank
C - RL shown is a Client Requested Quantitation Limit
E - Value above quantitation range
H - Holding times exceeded
I - Associated internal standard was outside method criteria
J - Analyte detected below quantitation limits
M - Manual Integration used to determine area response
ND - Not Detected at the Reporting Limit
R - RPD outside accepted recovery limits
S - Spike Recovery outside recovery limits
T - TIC(Tentatively identified compound)
X - Value exceeds Maximum Contaminant Level

Contamination present in the MBLK for multiple analytes. Sample results below the reporting limit are reportable per the TNI Standard.

Allowable Marginal Exceedance of Toluene in the laboratory control sample is verified per the TNI Standard.

Surrogate recovery is outside control limits due to matrix interference.

Allowable Marginal Exceedance of 1,1,2,2-Tetrachloroethane and trans-1,4-Dichloro-2-butene in the laboratory control sample is verified per the TNI Standard.

Surrogate recovery is outside control limits due to matrix interference.

Allowable Marginal Exceedance of 1,1,2,2-Tetrachloroethane and trans-1,4-Dichloro-2-butene in the laboratory control sample is verified per the TNI Standard.

Contamination present in the MBLK for multiple analytes. Sample results below the reporting limit are reportable per the TNI Standard.

Allowable Marginal Exceedance of Toluene in the laboratory control sample is verified per the TNI Standard.

Contamination present in the MBLK for multiple analytes. Sample results below the reporting limit are reportable per the TNI Standard.

Allowable Marginal Exceedance of Toluene in the laboratory control sample is verified per the TNI Standard.

Surrogate recovery is outside control limits due to matrix interference.

Allowable Marginal Exceedance of 1,1,2,2-Tetrachloroethane and trans-1,4-Dichloro-2-butene in the laboratory control sample is verified per the TNI Standard.

Contamination present in the MBLK for multiple analytes. Sample results below the reporting limit are reportable per the TNI Standard.

Allowable Marginal Exceedance of Toluene in the laboratory control sample is verified per the TNI Standard.

Contamination present in the MBLK for multiple analytes. Sample results below the reporting limit are reportable per the TNI Standard.

Allowable Marginal Exceedance of Toluene in the laboratory control sample is verified per the TNI Standard.

Contamination present in the MBLK for Methylene chloride. Sample results below the reporting limit are reportable per the TNI Standard.

Allowable Marginal Exceedance of Tetrachloroethene in the laboratory control sample is verified per the TNI Standard.

RE: FGDS Landfill **WorkOrder:** 26060603

Dear Eric Staley:

TEKLAB, INC received 10 samples on 6/18/2026 1:42:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Paul Schultz
Project Manager

Pschultz@teklabinc.com

Report Contents

Client: City Water, Light & Power
Work Order: 26060603
Client Project: FGDS Landfill
Report Date: 09-Jul-26

This reporting package includes the following:

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	6
Laboratory Results	7
Receiving Check List	18
Chain of Custody	Appended

Client: City Water, Light & Power **Work Order:** 26060603

Client Project: FGDS Landfill **Report Date:** 09-Jul-26

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
A	Total Coliform and/or E. Coli (Result) is absent
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
P	Total Coliform and/or E. Coli (Result) is present
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
S	Opinion for Colisure analysis is Satisfactory
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
T.O.P.	Top of Pump
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)
U	Opinion for Colisure analysis is Unsatisfactory

Definitions

Client: City Water, Light & Power
Work Order: 26060603
Client Project: FGDS Landfill
Report Date: 09-Jul-26

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Case Narrative

Pages to follow: Chain of custody 2 Extra pages included 24

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C 15.3
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice ☐
Chain of custody present?	Yes ☑	No ☐		
Chain of custody signed when relinquished and received?	Yes ☑	No ☐		
Chain of custody agrees with sample labels?	Yes ☑	No ☐		
Samples in proper container/bottle?	Yes ☑	No ☐		
Sample containers intact?	Yes ☑	No ☐		
Sufficient sample volume for indicated test?	Yes ☑	No ☐		
All samples received within holding time?	Yes ☑	No ☐		
Reported field parameters measured:	Field ☐	Lab ☐	NA ☑	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐		
When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.				
Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑	
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑	
Water - pH acceptable upon receipt?	Yes ☑	No ☐	NA ☐	
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑	

Any No responses must be detailed below or on the COC.

pH strip #104524. - NK/ekossakoski - 6/17/2026 3:18:09 PM

Samples were received on 6/18/26 at 1342 on ice [temp17.5C, 8.7C, 17.9C - LTG#9]. pH# 104524. Added nitric acid (110747) to G121, AW2. -NO/lhenson - 6/18/2026 2:16:16 PM

RE: 26060603

Dear Shelly Hennessy:

Order No.: 26061760

Alliance Technical Group - Akron received 10 sample(s) on 6/22/2026 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **26061760**
Date: **7/7/2026**

CLIENT: TEKLAB Inc,
Project: 26060603

WorkOrder Narrative:
26061760: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Alliance Technical Group Work Order Number assigned to this report.

Alliance Technical Group holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Alliance Technical Group and that of the customer. It cannot be reproduced in any form without the consent of Alliance Technical Group or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Alliance Technical Group is not responsible for use or interpretation of the data included herein.

All results for solid samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence Sample Notes:
26061760-001A Radium-228_NPW(904.0): Sample exhibits low yield, and is confirmed by DUP.
26061760-004A Radium-228_NPW(904.0): Sample exhibits low yield. Sample is an NPW.

Analytical Sequence QC Notes:
LCS/LCSD-97614 Radium-228_DW(904.0): LCS/LCSD demonstrate high RPD. Both results are within acceptable criteria individually.
26061760-001ADUP Radium-228_NPW(904.0): Sample exhibits low yield, and is confirmed by DUP.

Qualifiers and Acronyms

WO#: **26061760**
Date: **7/7/2026**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
D	Manual integration in which peak was deleted.
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	A deviation from the method was performed; Please refer to the Case Narrative for additional information.

Acroynms

ND	Not Detected
QC	Quality Control
MB	Method Blank
LCS	Laboratory Control Sample
LCS	Laboratory Control Sample Duplicate
QCS	Quality Control Sample
DUP	Duplicate
MS	Matrix Spike
MSD	Matrix Spike Duplicate
RPD	Relative Percent Different
ICV	Initial Calibration Verification
ICB	Initial Calibration Blank
CCV	Continuing Calibration Verification
CCB	Continuing Calibration Blank
RLC	Reporting Limit Check
DF	Dilution Factor

RL	Reporting Limit
MDL	Method Detection Limit
LOD	Level of Detection
LOQ	Level of Quantitation
PQL	Practical Quantitation Limit
CRQL	Contract Required Quantitation Limit
PL	Permit Limit
RegLvl	Regulatory Limit
MCL	Maximum Contamination Limit
MinCL	Minimum Compound Limit
RA	Reanalysis
RE	Reextraction
TIC	Tentatively Identified Compound
RT	Retention Time
CF	Calibration Factor
RF	Response Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

Collinsville, IL 62234

Cooler Temp: Sampler: Client QC Level: 2

Comments: **Please Issue reports and invoices via email only**
SHIP to ATG-Akron. Please analyze for Radium 226/228 per your usual methods.
Any changes to analysis/methods must be approved by Teklab, Inc.
Batch QC and standard EDD are required. State of Sample Origin = IL

Project# 26060603

Contact: Shelly Hennessy Email: shennessy@TekLabInc.com

Requested Due Date: Standard TAT Billing/PO: 41373 Phone: (618) 344-1004 x 1024

Temp: 21.3°C (21.2+0.1)

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

Chain of Custody

1. Is Chain of Custody complete? Yes ☑ No ☐ Not Present ☐
2. How was the sample delivered? FedEx

Log In

3. Coolers are present? Yes ☑ No ☐ NA ☐
4. Shipping container/cooler in good condition? Yes ☑ No ☐
   Custody seals intact on shipping container/cooler? Yes ☐ No ☐ Not Present ☑ NA ☐
   No. Seal Date: Signed By:
5. Was an attempt made to cool the samples? Yes ☐ No ☑ NA ☐
6. Were all samples received at a temperature of >0° C to 6.0°C Yes ☐ No ☑ NA ☐
   Not required
7. Sample(s) in proper container(s)? Yes ☑ No ☐
8. Sufficient sample volume for indicated test(s)? Yes ☑ No ☐
9. Are samples (except VOA and ONG) properly preserved? Yes ☑ No ☐
10. Was preservative added to bottles? Yes ☐ No ☑ NA ☐
11. Is the headspace in the VOA vials less than 1/4 inch or 6 mm? Yes ☐ No ☐ No VOA Vials ☑
12. Were any sample containers received broken? Yes ☐ No ☑
13. Does paperwork match bottle labels? Yes ☑ No ☐
    (Note discrepancies on chain of custody)
14. Are matrices correctly identified on Chain of Custody? Yes ☑ No ☐
15. Is it clear what analyses were requested? Yes ☑ No ☐
16. Were all holding times able to be met? Yes ☑ No ☐
    (If no, notify customer for authorization.)

Special Handling (if applicable)

17. Was client notified of all discrepancies with this order? Yes ☐ No ☐ NA ☑

RE: Ash Pond Monitoring Wells **WorkOrder:** 26060602

Dear Eric Staley:

TEKLAB, INC received 1 sample on 6/18/2026 1:42:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Client Project: Ash Pond Monitoring Wells **Report Date:** 08-Jul-26

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
A	Total Coliform and/or E. Coli (Result) is absent
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
P	Total Coliform and/or E. Coli (Result) is present
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
S	Opinion for Colisure analysis is Satisfactory
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
T.O.P.	Top of Pump
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)
U	Opinion for Colisure analysis is Unsatisfactory

Client: City Water, Light & Power
Work Order: 26060602

Client Project: Ash Pond Monitoring Wells
Report Date: 08-Jul-26

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Case Narrative

RE: 26060602

Dear Shelly Hennessy:

Order No.: 26061762

Alliance Technical Group - Akron received 1 sample(s) on 6/22/2026 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **26061762**
Date: **7/7/2026**

CLIENT: TEKLAB Inc,
Project: 26060602

WorkOrder Narrative:
26061762: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Alliance Technical Group Work Order Number assigned to this report.

Alliance Technical Group holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Alliance Technical Group and that of the customer. It cannot be reproduced in any form without the consent of Alliance Technical Group or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Alliance Technical Group is not responsible for use or interpretation of the data included herein.

All results for solid samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence QC Notes:
LCS/LCSD-97614 Radium-228_DW(904.0): LCS/LCSD demonstrate high RPD. Both results are within acceptable criteria individually.

Qualifiers and Acronyms

WO#: **26061762**
Date: **7/7/2026**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
D	Manual integration in which peak was deleted.
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	A deviation from the method was performed; Please refer to the Case Narrative for additional information.

Acroynms

ND	Not Detected
QC	Quality Control
MB	Method Blank
LCS	Laboratory Control Sample
LCS	Laboratory Control Sample Duplicate
QCS	Quality Control Sample
DUP	Duplicate
MS	Matrix Spike
MSD	Matrix Spike Duplicate
RPD	Relative Percent Different
ICV	Initial Calibration Verification
ICB	Initial Calibration Blank
CCV	Continuing Calibration Verification
CCB	Continuing Calibration Blank
RLC	Reporting Limit Check
DF	Dilution Factor

RL	Reporting Limit
MDL	Method Detection Limit
LOD	Level of Detection
LOQ	Level of Quantitation
PQL	Practical Quantitation Limit
CRQL	Contract Required Quantitation Limit
PL	Permit Limit
RegLvl	Regulatory Limit
MCL	Maximum Contamination Limit
MinCL	Minimum Compound Limit
RA	Reanalysis
RE	Reextraction
TIC	Tentatively Identified Compound
RT	Retention Time
CF	Calibration Factor
RF	Response Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: Ash Pond Monitoring Wells **WorkOrder:** 26071205

Dear Eric Staley:

TEKLAB, INC received 23 samples on 7/27/2026 3:20:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
A	Total Coliform and/or E. Coli (Result) is absent
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
P	Total Coliform and/or E. Coli (Result) is present
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
S	Opinion for Colisure analysis is Satisfactory
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
T.O.P.	Top of Pump
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)
U	Opinion for Colisure analysis is Unsatisfactory

Client: City Water, Light & Power

Work Order: 26071205

Client Project: Ash Pond Monitoring Wells

Report Date: 01-Sep-26

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Case Narrative

Carrier: Frank Barthol

Received By: CS

Completed by: Laura E Henson
On: 22-Jul-26

Reviewed by: Amber Dilallo
On: 28-Jul-26

Pages to follow: Chain of custody 8 Extra pages included 72

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C	24.1	
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice	☐	
Chain of custody present?	Yes ☑	No ☐				
Chain of custody signed when relinquished and received?	Yes ☑	No ☐				
Chain of custody agrees with sample labels?	Yes ☑	No ☐				
Samples in proper container/bottle?	Yes ☑	No ☐				
Sample containers intact?	Yes ☑	No ☐				
Sufficient sample volume for indicated test?	Yes ☑	No ☐				
All samples received within holding time?	Yes ☑	No ☐				
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐			
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐				

When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.

Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑
Water - pH acceptable upon receipt?	Yes ☑	No ☐	NA ☐
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑

Any No responses must be detailed below or on the COC.

pH strip #104524. -CRS/ lhenson - 7/22/2026 4:20:45 PM

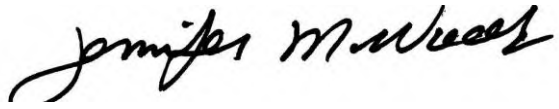
RE: 26071205

Dear Shelly Hennessy: Order No.: 26080027



Alliance Technical Group - Akron received 23 sample(s) on 7/31/2026 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **26080027**
Date: **8/28/2026**

CLIENT: TEKLAB Inc,
Project: 26071205

WorkOrder Narrative:
26080027: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Alliance Technical Group Work Order Number assigned to this report.

Alliance Technical Group holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Alliance Technical Group and that of the customer. It cannot be reproduced in any form without the consent of Alliance Technical Group or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Alliance Technical Group is not responsible for use or interpretation of the data included herein.

All results for solid samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence Sample Notes:
26080027-018A Radium-228_NPW(904.0): Parent sample and duplicate exhibited high RPD.
26080027-019A Radium-228_NPW(904.0): Parent sample and duplicate exhibited high RPD.

Analytical Sequence QC Notes:
LCS/LCSD-101685 Radium-228_NPW(904.0): LCS/LCSD exhibit high RPD. Both results are within acceptable criteria individually.
LCS/LCSD-101684 Radium-228_DW(904.0): LCS/LCSD exhibit high RPD. Both results are within acceptable criteria individually.

W	Sample container temperature is out of limit as specified at testcode		

Original

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
D	Manual integration in which peak was deleted.
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	A deviation from the method was performed; Please refer to the Case Narrative for additional information.

Acroynms

ND	Not Detected
QC	Quality Control
MB	Method Blank
LCS	Laboratory Control Sample
LCS	Laboratory Control Sample Duplicate
QCS	Quality Control Sample
DUP	Duplicate
MS	Matrix Spike
MSD	Matrix Spike Duplicate
RPD	Relative Percent Different
ICV	Initial Calibration Verification
ICB	Initial Calibration Blank
CCV	Continuing Calibration Verification
CCB	Continuing Calibration Blank
RLC	Reporting Limit Check
DF	Dilution Factor

RL	Reporting Limit
MDL	Method Detection Limit
LOD	Level of Detection
LOQ	Level of Quantitation
PQL	Practical Quantitation Limit
CRQL	Contract Required Quantitation Limit
PL	Permit Limit
RegLvl	Regulatory Limit
MCL	Maximum Contamination Limit
MinCL	Minimum Compound Limit
RA	Reanalysis
RE	Reextraction
TIC	Tentatively Identified Compound
RT	Retention Time
CF	Calibration Factor
RF	Response Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: FGDS Landfill **WorkOrder:** 26071206

Dear Eric Staley:

TEKLAB, INC received 8 samples on 7/27/2026 3:20:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
A	Total Coliform and/or E. Coli (Result) is absent
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
P	Total Coliform and/or E. Coli (Result) is present
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
S	Opinion for Colisure analysis is Satisfactory
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
T.O.P.	Top of Pump
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)
U	Opinion for Colisure analysis is Unsatisfactory

Definitions

Client: City Water, Light & Power
Work Order: 26071206
Client Project: FGDS Landfill
Report Date: 31-Aug-26

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

CHAIN OF CUSTODY

Pg 1 of 1 Workorder # 26071206

TEKLAB INC, 120 United Drive, Collinsville, IL 62234 Phone (618) 344-1004

Client: City Water, Light & Power
Address: 3100 Stevenson Drive, 2nd Floor Maintenance Building
City/State/Zip: Springfield IL 62712
Contact: Eric Staley Phone: (217) 757-8610
Email: eric.staley@cwlp.com Fax:

Samples on: [X] ICE [ ] BLUE ICE [ ] NO ICE 2.9 °C
Preserved in: [ ] LAB [ ] FIELD FOR LAB USE ONLY
LAB NOTES: PW 104524 KM 7-27-26

Client Comments:
*elevations, pH, conductivity, temperature
**Sb As Se Li Tl (ICPMS) Ba Be B Cd Ca Cr Co Pb Hg Mo

Are these samples known to be involved in litigation? If yes, a surcharge will apply: [ ] Yes [✓] No
Are these samples known to be hazardous? [ ] Yes [✓] No
Are there any required reporting limits to be met on the requested analysis?. If yes, please provide limits in the comment section: [✓] Yes [ ] No Permit on file

PROJECT NAME/NUMBER
FGDS Landfill

SAMPLE COLLECTOR'S NAME
Justin Culp

RESULTS REQUESTED
[✓] Standard [ ] 1-2 Day (100% Surcharge)
[ ] Other _____ [ ] 3 Day (50% Surcharge)

RE: 26071206

Dear Shelly Hennessy:

Order No.: 26080026

Alliance Technical Group - Akron received 8 sample(s) on 7/31/2026 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **26080026**
Date: **8/28/2026**

CLIENT: TEKLAB Inc,
Project: 26071206

WorkOrder Narrative:
26080026: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Alliance Technical Group Work Order Number assigned to this report.

Alliance Technical Group holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Alliance Technical Group and that of the customer. It cannot be reproduced in any form without the consent of Alliance Technical Group or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Alliance Technical Group is not responsible for use or interpretation of the data included herein.

All results for solid samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence Sample Notes:
26080026-003A Radium-228_NPW(904.0): Sample exhibits high RPD, possibly due to sample matrix. Sample is NPW.
26080026-005A Radium-228_NPW(904.0): Both parent and DUP results are below the reporting limit.
26080026-006A Radium-228_NPW(904.0): Parent sample and DUP exhibit high RPD possibly due to sample matrix. Sample is NPW.
26080026-007A Radium-228_NPW(904.0): Parent sample and DUP exhibit high RPD possibly due to sample matrix. Sample is NPW.

Analytical Sequence QC Notes:
LCS/LCSD-101685 Radium-228_NPW(904.0): LCS/LCSD exhibit high RPD. Both results are within

acceptable criteria individually.
LCS/LCSD-102077 Radium-228_DW(904.0): LCS/LCSD exhibit high RPD. Results are within acceptable limits individually.

Qualifiers and Acronyms

WO#: **26080026**
Date: **8/28/2026**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
D	Manual integration in which peak was deleted.
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	A deviation from the method was performed; Please refer to the Case Narrative for additional information.

Acroynms

ND	Not Detected
QC	Quality Control
MB	Method Blank
LCS	Laboratory Control Sample
LCS	Laboratory Control Sample Duplicate
QCS	Quality Control Sample
DUP	Duplicate
MS	Matrix Spike
MSD	Matrix Spike Duplicate
RPD	Relative Percent Different
ICV	Initial Calibration Verification
ICB	Initial Calibration Blank
CCV	Continuing Calibration Verification
CCB	Continuing Calibration Blank
RLC	Reporting Limit Check
DF	Dilution Factor

RL	Reporting Limit
MDL	Method Detection Limit
LOD	Level of Detection
LOQ	Level of Quantitation
PQL	Practical Quantitation Limit
CRQL	Contract Required Quantitation Limit
PL	Permit Limit
RegLvl	Regulatory Limit
MCL	Maximum Contamination Limit
MinCL	Minimum Compound Limit
RA	Reanalysis
RE	Reextraction
TIC	Tentatively Identified Compound
RT	Retention Time
CF	Calibration Factor
RF	Response Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

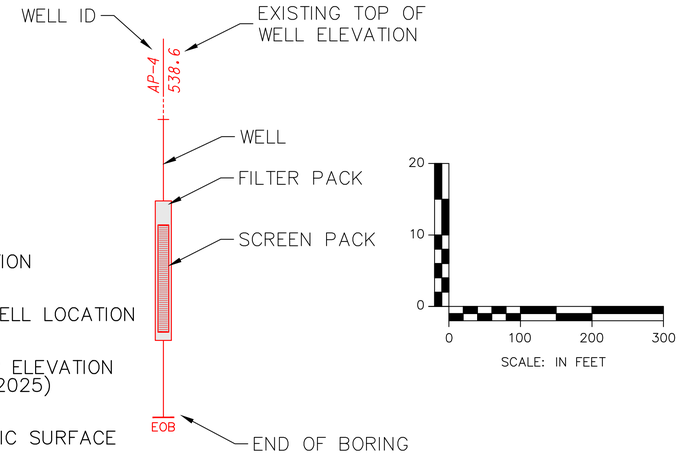
DATE: AUGUST 2024

© 2026 Andrews Engineering, Inc.



NOTES

1. DEPTH AND THICKNESS OF SUBSURFACE STRATA WERE GENERALIZED FROM AND INTERPOLATED BETWEEN BORINGS. INFORMATION ON ACTUAL SUBSURFACE CONDITIONS EXISTS ONLY AT THE LOCATION OF THE BORING. SEE BORING LOGS FOR DETAILED DESCRIPTION.
2. SURFACE GENERATED FROM LIDAR DATA DERIVED FROM USGS WEBSITE (FLIGHT DATE: MAY 16, 2023).
3. WELL/BORING SYMBOL PLACED AT SURFACE ELEVATION AT THE TIME THE BORING WAS COMPLETED.

NOTES

1. DEPTH AND THICKNESS OF SUBSURFACE STRATA WERE GENERALIZED FROM AND INTERPOLATED BETWEEN BORINGS. INFORMATION ON ACTUAL SUBSURFACE CONDITIONS EXISTS ONLY AT THE LOCATION OF THE BORING. SEE BORING LOGS FOR DETAILED DESCRIPTION.
2. SURFACE GENERATED FROM LIDAR DATA DERIVED FROM USGS WEBSITE (FLIGHT DATE: MAY 16, 2023).
3. WELL/BORING SYMBOL PLACED AT SURFACE ELEVATION AT THE TIME THE BORING WAS COMPLETED.

APPENDIX G:
GWSDAT DOCUMENTS

Appendix G-1: Supporting GWSDAT Methodology Reference
Statistical Basis of the GWSDAT Modeling Framework

Document Title
A Software Tool for the Spatiotemporal Analysis and Reporting of Groundwater Monitoring Data

Citation
Jones, W.R., Spence, M.J., Bowman, A.W., Evers, L., and Molinari, D.A. (2014). *A Software Tool for the Spatiotemporal Analysis and Reporting of Groundwater Monitoring Data*. *Environmental Modelling & Software*, 55, 242-249.

Purpose of Inclusion
This document is provided as supporting technical literature describing the statistical framework implemented within GWSDAT.

The publication discusses:

- Spatiotemporal groundwater data analysis;
- Groundwater concentration surface generation;
- Trend analysis;
- Spatial and temporal smoothing;
- Groundwater plume visualization;
- Data treatment methods used in groundwater monitoring evaluations.

The methodology described in this publication provides the technical basis for generation of concentration surfaces and plume interpretations used in this Addendum.

ABSTRACT

The GroundWater Spatiotemporal Data Analysis Tool (GWSDAT) is a user friendly, open source, decision support tool for the analysis and reporting of groundwater monitoring data. Uniquely, GWSDAT applies a spatiotemporal model smoother for a more coherent and smooth interpretation of the interaction in spatial and time-series components of groundwater solute concentrations. Data entry is via a standardised Microsoft Excel input template whilst the underlying statistical modelling and graphical output are generated using the open source statistical program R. This paper describes in detail the various plotting options available and how the graphical user interface can be used for rapid, rigorous and interactive trend analysis with facilitated report generation. GWSDAT has been used extensively in the assessment of soil and groundwater conditions at Shell's downstream assets and the discussion section describes the benefits of its applied use. Finally, some consideration is given to possible future developments.

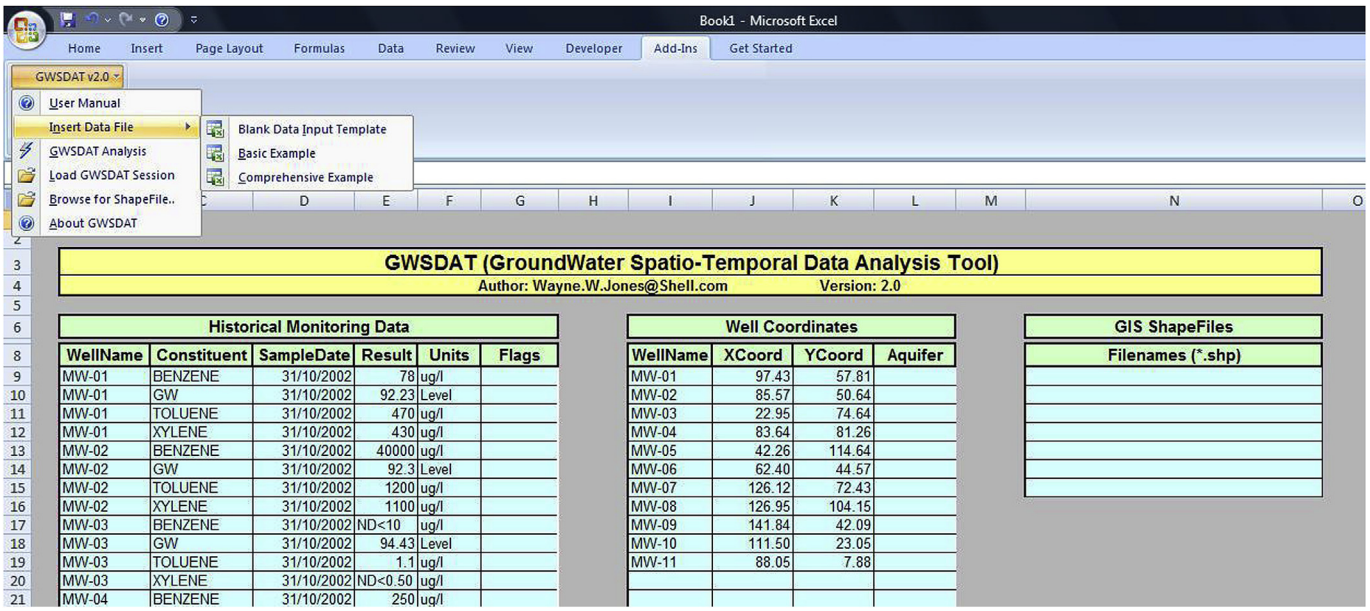
Software availability

Software name: GWSDAT (GroundWater Spatiotemporal Data Analysis Tool)
Developer: Wayne R. Jones
Contact address: Shell Global Solutions (UK) (wayne.w.jones@shell.com)
Year first official release: 2013
Hardware requirements: Standard PC
System requirements: Microsoft Windows (XP or later)
Software requirements: Microsoft Office (Excel, Word and PowerPoint) and R (www.r-project.org)
Program Size: 13 MB
Availability: www.claire.co.uk/GWSDAT
License: Free under a GNU General Public License (www.gnu.org) agreement.
Documentation and support for users: User manual, example data sets, FAQ document, presentations and posters.



1. Introduction

1.1. Background

Groundwater is water located beneath the Earth's surface in soil pore spaces and in the fractures of rock formations. Environmental monitoring of groundwater is routinely conducted in areas where the risk of contamination is high and for protecting human health and the environment following an accidental release of hazardous constituents. Groundwater monitoring strategies are designed to establish the current status and assess trends in environmental parameters, and to enable an estimate of the risks to human health and the environment. It involves installing a network of monitoring wells to enable access to the water table across the site (Barcelona et al., 1985). Samples of groundwater are periodically collected from these wells and sent to an accredited laboratory for chemical analysis. The resulting spatiotemporal data set has to be reviewed,

Fig. 1. GWSDAT example data input template. The *Historical Monitoring Data* table captures the concentration data, groundwater levels and, if present, NAPL thickness. The *Well Coordinates Table* stores the location of the monitoring well. The GWSDAT add-in menu is displayed at the top left.

analysed statistically, interpreted, and the results presented to environmental regulators in a clear and understandable manner.

The most basic method of level and trend evaluation involves investigating the time-series of groundwater constituent concentrations independently on a well by well basis. The more sophisticated spatial methods, typically, involve fitting a concentration trend surface (i.e. Kriging) to evaluate spatial pattern and trend (Cameron and Hunter, 2002; Gaus et al., 2003). However, although spatiotemporal data lies at the heart of current research in statistical methods (see Cressie and Wikle (2011)), the most common practice is to independently apply spatial modelling techniques to separate monitoring events (e.g. Ricker (2008)) or apply a single spatial model to a data set which has been consolidated over a time period (e.g. Aziz et al. (2003)). The joint modelling of both spatial and time elements in a single spatiotemporal modelling framework leads to a more coherent interpretation of site groundwater characteristics (Evers et al., in press).

Whilst there is a range of freely available groundwater data analysis applications, the most sophisticated tend to be designed for large scale long term groundwater monitoring networks (Aziz et al., 2003; Cameron, 2004). These have a relatively large initial data warehousing setup burden, which may be viewed as a barrier to the more widespread use of advanced groundwater monitoring techniques to smaller more short term monitoring programmes. Similarly, whilst GIS applications (e.g. ArcGIS) have excellent visualisation tools for geographical interpretation they also have a high initial data setup cost, operator competence requirements, and perhaps surprisingly, only a limited number of geostatistical modelling techniques available.

2. Software design and aims

2.1. Development aims

To a large extent, GWSDAT has been developed to address the barriers discussed in Section 1.1. However, its most important aim is to provide a simple to use, but statistically powerful decision support tool to environmental engineers and practitioners who routinely report on the status of numerous groundwater monitoring sites. Such an application needs to be easy to setup yet powerful in its ability to objectively analyse and rapidly report on a groundwater monitoring site's characteristics.

In common with many other environmental applications, it was recognised that there would be a benefit in providing the software in an open and transparent manner because policy makers and environmental regulators generally prefer code and techniques which are fully transparent and supported by sound science (Carslaw and Ropkins, 2012).

2.2. Software architecture

GWSDAT has been designed to integrate with Microsoft Excel, a software routinely used by environmental engineers for storing and analysing environmental (e.g. soil and groundwater) data. The user entry point to GWSDAT is a custom built Excel Add-in menu (see top left of Fig. 1).

The statistical engine used to perform geostatistical modelling and display graphical output is the open source statistical programming language R (R Development Core Team, 2012). The R project is used across a wide range of disciplines and has been adopted with eagerness by the environmental sciences community (Carslaw and Ropkins, 2012). Members of the R community contribute statistical routines and functionality to this collaborative project by means of an open standardised package structure, which can be downloaded and installed from http://cran.r-project.org/web/packages/. GWSDAT makes use of several of these packages, which are all individually referenced in this article. A Graphical User Interface (GUI) is provided via the R packages *rpanel* (Bowman et al., 2007) and *tkrplot* (Tierney, 2011) which obviates the need for training GWSDAT users in the R programming language.

3. Data input

3.1. Background

Before describing the application of GWSDAT in more detail it is necessary to give a brief explanation of the nature of groundwater monitoring data. In general, routine sampling of a monitoring well involves measuring the groundwater elevation and taking a sample of the groundwater which is subsequently sent for laboratory

analysis to ascertain the dissolved concentration of a prescribed set of solutes (e.g. Toluene, Benzene). If the concentration is deemed lower than that which could be detected using the method employed by the laboratory then it is classified as a 'non-detect'. In such circumstances, the laboratory quotes the detection threshold concentration value below which the solute could not be detected.

An additional important consideration for petroleum hydrocarbon applications is the presence of a layer of Non-Aqueous Phase Liquid (NAPL), such as gasoline or diesel, on the surface of the water table. This circumstance often arises when the amount of contamination is sufficient to exceed the natural solute level of groundwater. Samples containing NAPL are not often sent for a full chemical analysis (unless performing NAPL forensics) because the levels of solute concentrations are too high for the traditional laboratory methods, which are geared towards lower concentrations. Hence, NAPL data poses the challenge of how to handle unspecified high solute concentration values and identify trends in NAPL layer thickness.

3.2. Input data format

Groundwater monitoring data is entered into GWSDAT by means of a simple standardised Microsoft Excel input sheet (Fig. 1). There is no requirement to gather any data that would not have already been recorded in a standard groundwater monitoring data set. The following summarises the GWSDAT data input format but the reader is referred to the user manual for a full and detailed explanation of GWSDAT data input specification.

Each row of the *Historical Monitoring Data* table (left hand table in Fig. 1) corresponds to a unique combination of well id, sampling date, aquifer zone, solute name and concentration. Non-detect solute data is entered using the notation 'ND < X', where X represents the laboratory reported detection threshold concentration. If present, NAPL thickness data is also entered in this table using the constituent name 'NAPL' with an appropriate unit, e.g. metres, mm. Optionally, groundwater level data is entered here (using the constituent name 'GW') as an elevation above a common datum, e.g. metres or feet above sea level or some other common reference height.

The *Well Coordinates* table (middle table in Fig. 1) stores the coordinates of the groundwater monitoring wells. Any arbitrary coordinate system with an aspect ratio of 1 can be used, i.e. a unit in the x-coordinate is the same distance as a unit in the y-coordinate.

The third optional *GIS Shapefiles* table can be populated with file locations of GIS shapefiles (Esri, 1998) for use as basemaps or site plans. Two GWSDAT input data sets of varying complexity (basic and comprehensive) are included with the software to serve as both an example of the GWSDAT data input format and provide a quick way of getting started.

3.3. Data processing

On initiation of a GWSDAT analysis, the user is asked to select from a variety of data processing options including the handling of non-detects and, if present, NAPL. In accordance with the common convention, the default option is to substitute the non-detect solute concentration data with half its detection limit. Note, however, that this can mask trends in the data and lead to erroneous estimates of summary statistics in cases with a high proportion of non-detect results (Helsel, 2004). This issue is discussed in more detail in Section 6. If NAPL is present the user is prompted to substitute NAPL data points with site data set maximum observed solute concentrations. This option is to provide a more realistic picture of the area of impacted groundwater (high concentrations) in the event that NAPL in wells prevents direct measurement of solute concentrations as discussed in Section 3.1. The data processing step is concluded with a series of data validation procedures to check for common data input errors.

4. Graphical user interface

4.1. Introduction

In the interests of user-friendliness and productivity the results of a GWSDAT analysis are interrogated and interpreted through the GWSDAT user interface (see Fig. 2). It includes a wide range of different plots for the visual inspection of groundwater monitoring data. The objective assessment of trend is achieved by the application of statistical smoothing models described in Appendix A. The following sections describe the individual components of the GWSDAT user interface in more detail.

4.2. Well trend plot

The well trend plot (see Fig. 3) enables the user to investigate time series trends of solute concentrations and groundwater level in individual wells. Sampled concentration values are displayed using orange circles for non-detect data and black solid circles for detectable data. The user can choose to overlay a linear (or log-linear) regression model fit and use the non-parametric Mann–Kendall approach to trend detection via the R package *Kendall* (McLeod, 2011). Although this approach is widely used in environmental sciences (e.g. Hirsch et al. (1982); Helsel and Hirsch (2002)) its major weakness is that it can only detect monotonic trend and in response GWSDAT adopts an additional methodology. The solid blue line in Fig. 3 displays the estimate (together with a 95% confidence interval) of the mean trend level according to a local linear regression model fit described in Appendix A.1. This non-parametric model smoothing technique is not constrained to be monotonic and can change direction as is clearly illustrated in the figure. The trend between two points in time is, informally speaking, deemed statistically significant if the associated confidence intervals do not overlap (Fig. 4).

For evaluating the impact of changing (perhaps seasonal) water table conditions groundwater elevation data can, optionally, be overlaid in this plot. The time series of observed groundwater level is represented by open circles joined by a black solid line see and the values read off from the right hand axis (see Fig. 3). If present, NAPL thickness data can also be displayed in a similar manner.

4.3. Trend and threshold indicator matrix

The trend and threshold indicator matrix is a summary of the level and time-series trend in solute concentrations at a particular time-slice of the monitoring period. The rows correspond to each monitoring well and the columns correspond to the different solutes. The date of the time-slice is displayed at the top of the plot and also indicated by a vertical grey line in the well trend plot (see Fig. 3). The user can select between the options of displaying 'Trend', 'Threshold – Absolute' or 'Threshold Statistical'.

When 'Trend' is selected the cells are coloured to indicate the strength and direction of the current trend as assessed by the instantaneous gradient of the well trend smoother (see Section 4.2) at the current time-slice. White cells indicate a generally flat trend whilst reds and greens indicate strong upward and downward trends, respectively. In the event that the trend cannot be calculated (e.g. no data) then the corresponding cell is coloured grey. Blue cells represent non-detect data.

When 'Threshold Absolute' is selected the cells are coloured according to whether the observed current solute concentrations

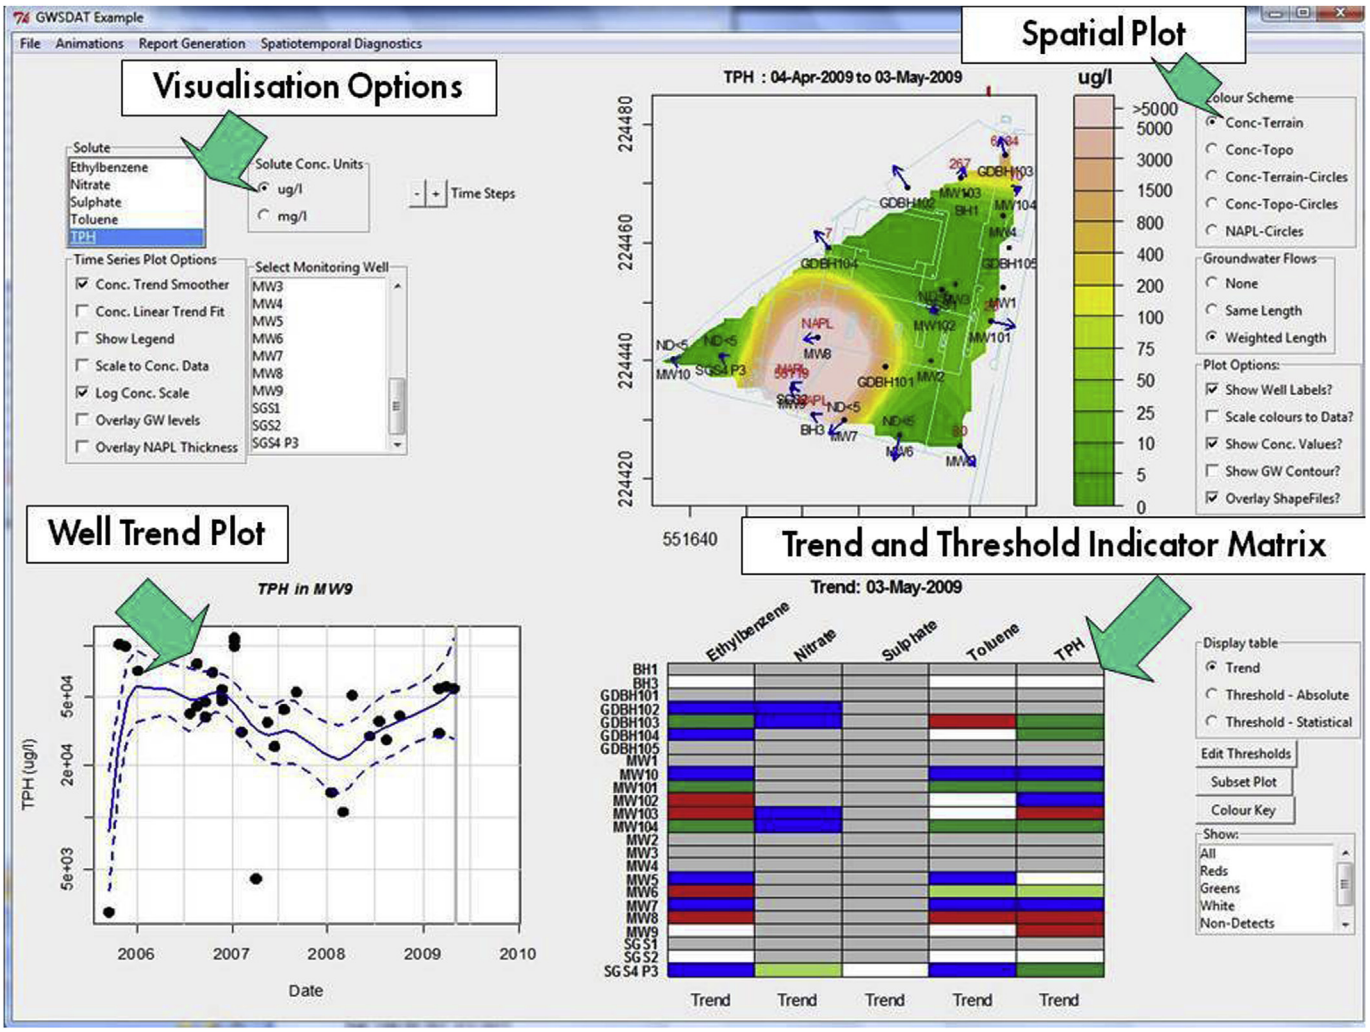

Fig. 2. The GWSDAT graphical user interface is a stand-alone, point and click, Graphical User Interface (GUI) which enables the user to perform a rapid, rigorous and interactive analysis of trends in the time-series, spatial and spatiotemporal components of the data.

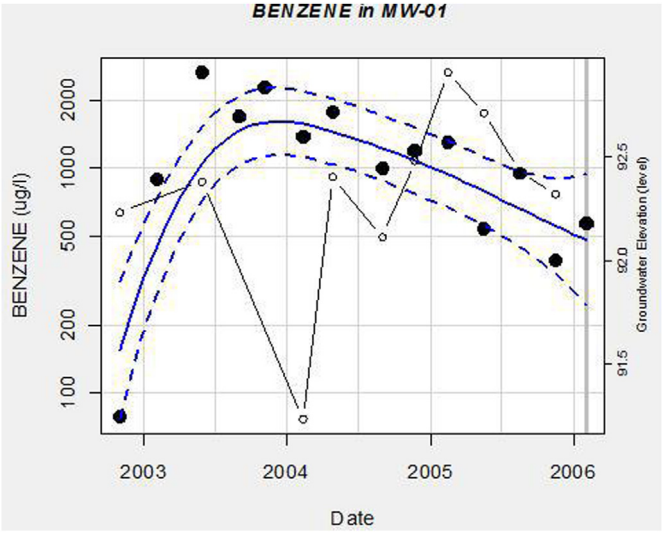

Fig. 3. Example of the GWSDAT well trend plot. The black solid circles represent observed concentration values. Overlaid in the solid blue line is a local linear regression model fit with 95% confidence interval, shown as dashed blue lines. The open circles joined by solid line represent groundwater elevation measurements which are read off from the right hand axis.

are below a user specified threshold value, such as a risk-based remedial objective. The cells are coloured red if the current solute concentration is above the threshold value and green otherwise. 'Threshold Statistical' is similar but only colours the cell green if the upper 95% confidence interval of the well trend smoother (see Section 4.2) is below the threshold value.

4.4. Spatial plot

The GWSDAT spatial plot (see Fig. 5) is for the analysis of spatial trends in solute concentrations, groundwater flow and, if present, NAPL thickness. It displays the locations of the named monitoring wells together with sample solute concentration values collected within the date interval displayed at the top of the graphic. If desired, the major site features (e.g. roads, fuel tanks), supplied in a GIS shapefile format, can be overlaid on the spatial plot as light blue lines. As the user increments forwards and backwards through the monitoring history, using the '+' and '−' *Time Steps* buttons, the spatial plot is updated.

The estimated groundwater flow direction and magnitude is depicted with blue arrows calculated using the method described in Appendix A.2. Additionally, it is possible to overlay a contour plot of groundwater elevation. This is achieved by drawing isopleths through a fitted local polynomial regression model fit implemented

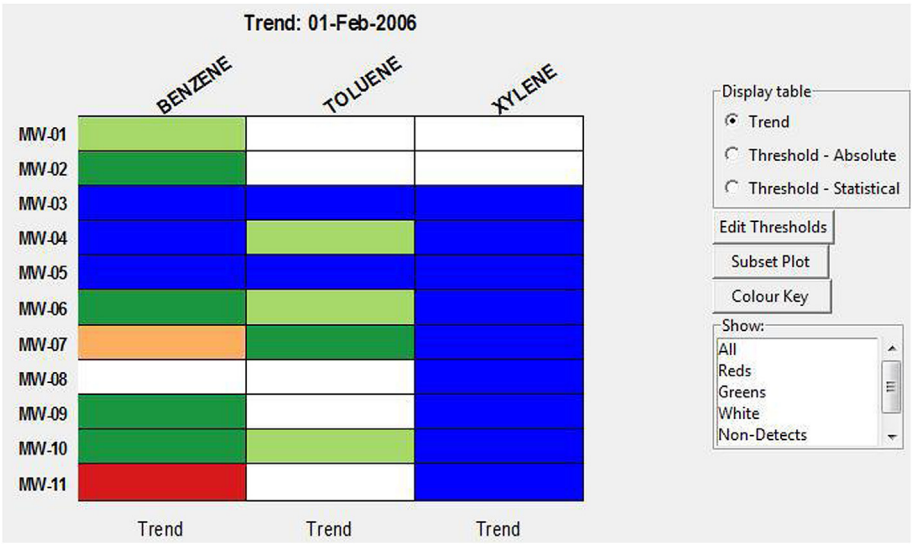

Fig. 4. Example of the GWSDAT trend and threshold indicator matrix. The rows represent monitoring wells, and columns represent the different solutes. Each cell is colour coded to represent increasing (reds), stable (white) or decreasing (greens) trends in solute concentrations. Blue cells represent non-detect data and if there is insufficient data the cell is coloured grey.

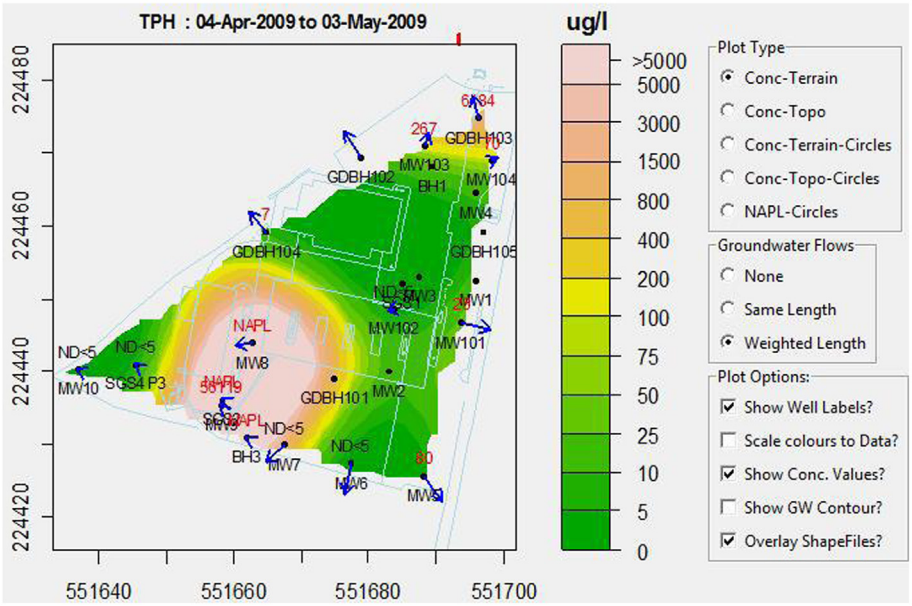

Fig. 5. Example of the GWSDAT spatial plot. The location of the named monitoring wells is depicted with black solid circles. Detect data or NAPL is displayed in a red font and non-detect in a black font above the wells. Blue arrows indicate vectors of estimated groundwater flow velocity. Spatiotemporal solute concentration smoother predictions are superposed using the colour key on the right. GIS shapefile data is overlaid using light blue lines.

using the R function *loess* – a 2D variant of the local linear regression method explained in Appendix A.1.

The spatial distribution of solute concentration is estimated by taking a time-slice through the spatiotemporal concentration smoother (discussed further in Section 4.5). The model predictions are superposed on the spatial plot with a user-specified colour key located to the right of the plot. Alternatively, if no model based predictions are required, the concentration smoother can be replaced by size scaled colour coded circles representing the magnitude of sampled solute concentration values. If NAPL is present, the additional 'NAPL-Circles' option is available which displays NAPL thickness measurements at the monitoring well locations using a similar circle based representation, i.e. a bubble-plot.

The spatial plot uses the R packages, *sp* (Pebesma and Bivand, 2005), *splancs* (Rowlingson et al., 2012) and *maptools* (Lewin-Koh et al., 2012).

4.5. Spatiotemporal trend analysis

One of GWSDAT's unique features is that the spatial and temporal components of the solute concentration data are modelled jointly in a single modelling framework described in Appendix A.3. The simultaneous statistical smoothing of both spatial and temporal components provides a clearer and more insightful interpretation of the groundwater monitoring site solute characteristics than would otherwise be gleaned from analysing these two components

separately. However, it is not an inconsiderable challenge to effectively communicate the 3-dimensional nature of spatiotemporal trend through a 2-dimensional medium of a computer monitor. Furthermore, there is an additional constraint that the output from a GWSDAT analysis is commonly used in paper-based non-interactive reports submitted to environmental regulators. For this reason, GWSDAT communicates spatiotemporal trend through automatic plotting of the full temporal sequence of spatial plots (see Section 4.4). This animation based approach provides a 'movie' clearly illustrating how both the spatial and temporal distribution of historical groundwater solute concentrations have changed over the monitoring period.

The 'animations' menu located at the top-left of the GWSDAT user interface (Fig. 2) provides three different methods for generating animations. The first method plots and records the full sequence of spatial plots in an R graphics window. The user can toggle forwards and backwards through the sequence of spatial plots using the 'Page Up' and 'Page Down' keyboard buttons. The second method is identical but additionally generates a Microsoft PowerPoint slidepack of the full sequence of spatial plots. The third method uses the R package *animation* (Xie, 2012), to generate a html animation page (with controls) of spatial plots in the user's internet browser. The html animation can be viewed independently of GWSDAT, and hence provides an excellent dynamic media for communicating results to individuals who do not have direct access to GWSDAT.

4.6. Report generation

By left-clicking on any of the GWSDAT user interface plots, an identical but expanded plot is generated in a separate R graphics window. Plots can be saved to a variety of different formats including 'jpeg', 'postscript', 'pdf', 'metafile'. Alternatively, with a single click of a mouse, plots and sequences of plots (e.g. spatiotemporal animation described in Section 4.5) can be diverted directly in to Microsoft Word or PowerPoint. This functionality, implemented using the R package *RDCOMClient* (Lang, 2012), enables the user to interactively compile a site groundwater monitoring report in an expeditious manner.

Additional report generation functionality include the 'Well Reporting' procedure, implemented using the R package *lattice* (Sarkar, 2008), which generates a matrix of graphs displaying time series solute concentration values on a well by well basis (see Fig. 6). This plot can be used to very concisely summarise the time series trends in the complete set of solutes and monitoring wells. A similar report procedure 'GW Well Reporting' also allows for the overlay of the time series in groundwater elevation at each well. Finally, the 'Latest Snapshot' procedure generates a sequence of plots (to PowerPoint if required) which reports on the most recent trends. This includes the latest spatial plot for each solute together with the most recent three variants of the 'Trend and Threshold Indicator Matrix' plot described in Section 4.3.

5. Discussion

Environmental risk-based management decisions are often based on limited understanding of groundwater data, and relatively limited statistical analysis of that data. GWSDAT has been designed and developed as a user-friendly, interactive, trend analysis tool for distilling the information from such groundwater monitoring data sets. The application has been used operationally in the monitoring and assessment of Shell's global downstream assets (e.g. refineries, terminals, fuel stations) for a period of over 4 years. Graphical output generated from GWSDAT is routinely included in reports

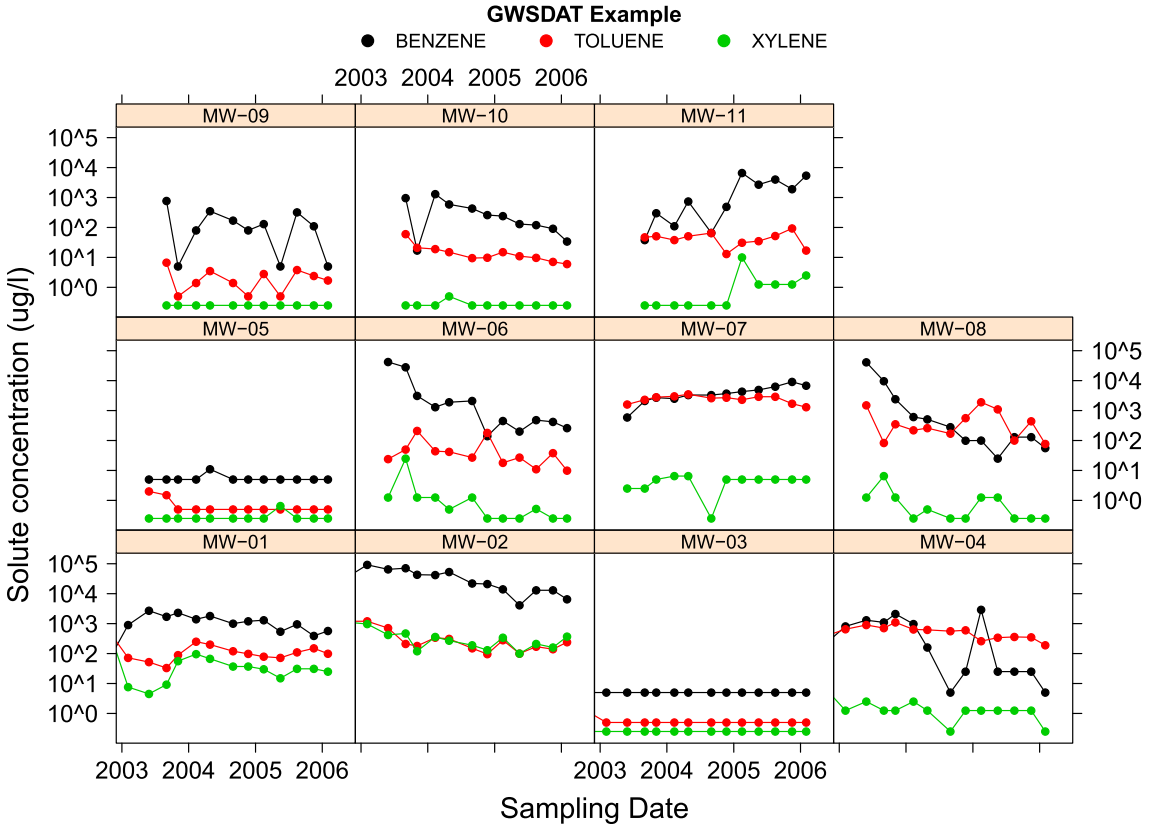

Fig. 6. Example of the GWSDAT Well report plot. The colour key at the top identifies each solute and the name of each well is displayed in a banner at the top of each of the individual time series graphs. This clearly illustrates the correlation in time series trends across the different solutes.

submitted to environmental regulators. Environmental engineers using GWSDAT have reported numerous benefits:

- Rapid interpretation of complex data sets for both small and large groundwater monitoring networks.
- Earlier identification of new spills or off-site migration.
- Reduced reliance on engineered remediation through increased use of monitored natural attenuation remedies, where groundwater data analysis supports its effectiveness.
- Earlier closeout of sites in needless long-term monitoring and/or remediation.
- Simplified preparation of groundwater monitoring reports.

6. Future developments

The major area for future development is the addition of new capabilities to GWSDAT. The assessment of solute plume stability is currently carried out by visually inspecting the evolution of the spatiotemporal solute concentration smoother. Feedback from users has highlighted the need for additional quantitative tools to supplement this graphical method. Development is currently underway to incorporate plume mass balance tools, such as those proposed in Ricker (2008), to automatically estimate plume characteristics such as area, total mass and centre of mass. The inspection of these quantities over the monitoring period will more objectively illustrate whether the plume is moving and if the plume is growing, shrinking or stable.

Future versions of GWSDAT will use spatiotemporal model standard errors to give the user a better understanding of model uncertainty and goodness of fit. The spatial distribution of model standard errors is of particular interest because it provides an assessment of the design of the well monitoring network. Areas of low monitoring density will have larger model standard errors. This not only informs the user that the predictions in this area need to be interpreted with care but also identifies potential locations where the construction of new monitoring wells would improve conceptual understanding of a site, and project decision-making. Model standard errors could also be used in the calculation of the solute plume characteristics mentioned above to provide a confidence interval on these quantities.

Whilst simple to implement, the substitution of non-detect concentration values is not without its disadvantages as discussed by Helsel (2004). These are partly mitigated in GWSDAT by offering the 'worse case' scenario of substitution with the full detection limit as opposed to the usual value of half the detection limit. However, the occurrence of different detection limits for the same solute (perhaps because different laboratories were used during the course of a long-term monitoring programme) is still troublesome as substitution with any constant fraction leads to an apparent trend in concentrations. The authors are currently researching more sophisticated censored regression techniques to handle non-detect data in the spatiotemporal modelling framework.

Appendix A. Description of statistical modelling techniques

Appendix A.1. Well trend plot smoother

The well trend plot smoother is fitted using a non-parametric method called local linear regression. This involves solving locally the least squares problem:

$$\min_{\alpha,\beta} \sum_{i}^{n} \{y_i - \alpha - \beta(x_i - x)\}^2 w(x_i - x; h) \tag{A.1}$$

where $w(x_i - x;\ h)$ is a weight function with parameter h. The weight function gives the most weight to the data points nearest the point of estimation and the least weight to the data points that are furthest away. For the weight function GWSDAT uses a normally-distributed probability density function with standard deviation h. Local linear regression is deployed in GWSDAT using the R package *sm* (Bowman and Azzalini, 2010, 1997) and h is selected using the method published in Hurvich et al. (1998).

Appendix A.2. Groundwater flow estimation

Vectors of groundwater flow strength and direction are estimated using the well coordinates and recorded groundwater elevations. The model is based on the simple premise that local groundwater flow will follow the local direction of steepest descent (hydraulic gradient).

For a given well, a linear plane is fitted to the local groundwater level data:

$$L_i = a + bx_i + cy_i + \epsilon_i \tag{A.2}$$

where L_i represents the groundwater level at location (x_i, y_i). Local data is defined as the neighbouring wells as given by a Delaunay triangulation (Ahuja and Schacter, 1983; Turner, 2012) of the monitoring well locations. The gradient of this linear surface in both x and y directions is given by the coefficients b and c. Estimated direction of flow is given by:

$$\theta = \tan^{-1}\left(\frac{c}{b}\right) \tag{A.3}$$

and the relative hydraulic gradient (a measure of relative flow velocity) is given by

$$R = \sqrt{b^2 + c^2} \tag{A.4}$$

For any given model output interval this algorithm is applied to each and every well where a groundwater elevation has been recorded.

Appendix A.3. Spatiotemporal solute concentration smoother

The spatiotemporal solute concentration smoother is fitted using a non-parametric regression technique known as Penalised Splines (Eilers and Marx, 1992, 1996). A full and detailed explanation of applying this statistical method to groundwater monitoring data is the subject of another paper (Evers et al., 2014). However, the following outlines some of the most important aspects for the purposes of GWSDAT.

Let y_i be the natural log solute concentration at $x_i = (x_{i1}, x_{i2}, x_{i3})$ where x_{i1} and x_{i2} stand for the spatial coordinates of the well and x_{i3} represents the corresponding time point for the i-th observation with $i = 1, \ldots, n$. We start by modelling the solute concentration as

$$y_i = \sum_{j=1}^{m} b_j(\boldsymbol{x_i})\alpha_j + \epsilon_i \tag{A.5}$$

where the $b_j, j = 1, \ldots, m$ are m B-Spline basis functions, generally second or third order polynomials (Eilers and Marx, 1996). The measurement errors ϵ_i's are assumed to be independent and identically normally distributed with zero mean and variance σ^2. Rewriting Equation (A.5) in the more compact matrix notation leads to

$$\mathbf{y} = \mathbf{B}(\mathbf{x})\boldsymbol{\alpha} + \boldsymbol{\epsilon} \tag{A.6}$$

The traditional ordinary least squares approach is to minimize the objective function $S(\boldsymbol{\alpha}) = ||\boldsymbol{\epsilon}||^2 = \|\boldsymbol{y} - \boldsymbol{B}(\boldsymbol{x})\boldsymbol{\alpha}\|^2$. The well known major disadvantage of this approach is its propensity to overfit data leading to under smoothness in model predictions. To overcome this hurdle, the objective function is modified with the addition of a term that penalises the finite differences of the coefficients of adjacent B-splines. The objective function now takes the form $S(\boldsymbol{\alpha}) = \|\boldsymbol{y} - \boldsymbol{B}(\boldsymbol{x})\boldsymbol{\alpha}\|^2 + \lambda\|D_d\alpha\|^2$ where D_d is a matrix such that $D_d = \Delta^d$, the d-th differences of α, and λ is a nonnegative tuning parameter.

By minimising the new objective function for a given value of λ, we obtain the estimator of the parameters $\widehat{\boldsymbol{\alpha}} = (\boldsymbol{B}'\boldsymbol{B} + \lambda\boldsymbol{D}_d'\boldsymbol{D}_d)^{-1}\boldsymbol{B}'\boldsymbol{y}$. Note that when $\lambda = 0$, we have the standard ordinary least squares estimate for $\widehat{\boldsymbol{\alpha}}$.

Optimal selection of the penalisation parameter λ is a subtle and important matter. A value which is too small leads to 'overfitting', i.e. capturing the noise in the data. Conversely, a value which is too large leads to over smoothing of the data, i.e. 'underfitting'. Several criteria have been traditionally proposed (e.g. Hurvich et al. (1998), Wood (2006)) but the authors tackled this problem using a Bayesian modelling framework which is detailed in Evers et al. (2014).

Purpose of Inclusion

This document is provided as supporting technical literature describing the Bayesian spatiotemporal regression methodology underlying GWSDAT.

The publication documents:

- Penalized spline (P-spline) regression;
- Spatiotemporal modeling techniques;
- Smoothing parameter selection;
- Groundwater contaminant concentration modeling;
- Development of continuous concentration surfaces from groundwater monitoring datasets.

The statistical methods described in this document support the concentration-surface generation and plume characterization procedures used in the GWSDAT evaluation presented in this Addendum.

Efficient and automatic methods for flexible regression on spatiotemporal data, with applications to groundwater monitoring

L. Evers[a]*, D. A. Molinari[a], A. W. Bowman[a], W. R. Jones[b] and M. J. Spence[b]

Fitting statistical models to spatiotemporal data requires finding the right balance between imposing smoothness and following the data. In the context of P-splines, we propose a Bayesian framework for choosing the smoothing parameter, which allows the construction of fully automatic data-driven methods for fitting flexible models to spatiotemporal data. An implementation, which is highly computationally efficient and exploits the sparsity of the design and penalty matrices, is proposed. The findings are illustrated using a simulation study and two examples, all concerned with the modelling of contaminants in groundwater. This suggests that the proposed strategy is more stable that competing methods based on the use of criteria such as generalised cross-validation and Akaike's Information Criterion. © 2015 The Authors. *Environmetrics* Published by John Wiley & Sons, Ltd.

1. INTRODUCTION

Spatiotemporal data have become ubiquitous. In some settings, this has been driven by the development of affordable technology for data collection where spatially located networks of sensors collect data over time. In environmental monitoring, multiple sensors are routinely used to gather data over time, in air, water or land settings. Brain imaging using electro-encephalography or magneto-encephalography is another example where around 200 sensors each record brain signals at very high time resolution, generating large volumes of data. In many scientific contexts, measurements are increasingly made automatically, leading to high-resolution data with a strong degree of regularity, while on other occasions, visits to sites of interest by trained personnel may be required, leading to sparser and more irregular data patterns. The problem discussed in the present paper deals with measurements of groundwater collected from wells and sent for subsequent lab analysis. Barcelona *et al.* (1985) describe the practical details. As mentioned earlier, the practicalities and cost of this inevitably lead to irregularity in time and also in space.

Models for the analysis and interpretation of spatiotemporal data have developed rapidly to match the demands of the data now available and the underlying questions. Sometimes, prediction is the aim, while on other occasions, interest can be directed at assessing the mean levels of the measurement and evidence for change over time. Banerjee *et al.* (2004), Finkenstädt *et al.* (2007) and Cressie and Wikle (2011) provide excellent entry points to the large literature on spatiotemporal modelling, with the last book very helpfully giving coverage of modern hierarchical and dynamic methods in both breadth and depth. These models are usually implemented in a Bayesian setting. In the wider literature, a unifying theme is the expectation that the spatial and temporal patterns exhibited will not follow simple parametric forms, so that models, which can express flexible, but generally smooth shapes, are required. One approach is to apply flexible forms of regression, described for example by Wood (2006), in the spatiotemporal setting. Bowman *et al.* (2009) take this approach to the modelling of sulfur dioxide over Europe throughout the 1990s. P-splines, described by Eilers and Marx (1996), and more general regression splines, offer a very interesting approach through the use of relatively low-dimensional sets of basis functions, and Lee and Durban (2011) apply this to the spatiotemporal modelling of ozone over Europe. The formulation of P-splines offers an interpretation in terms of mixed effects, and Ruppert *et al.* (2003) showed a wide range of settings to which these models can be applied when the random effect interpretation is appropriate. A fully Bayesian P-splines model was introduced by Lang and Brezger (2004), with inference carried out by Markov chain Monte Carlo MCMC. Fahrmeir *et al.* (2004) adopted a model of this type in the specific setting of spatiotemporal data with an empirical Bayes approach, which returns again to a mixed-model representation. Brezger and Lang (2006) provided a wider range of models and efficient updating schemes,

while Brezger and Lang (2008) discussed simultaneous probability statements for Bayesian P-spline models, again in the context of MCMC implementation. More recently, Wood (2011) explored the Restricted maximum likelihood (REML) approach in detail and developed a fast implementation in a generalised linear modelling framework.

The context of the application discussed in this paper is the monitoring of contamination in groundwater. It is clearly important to assess water quality and its associated risks to human health and the wider environment, and in particular, to detect sudden increases in contaminant concentration due to possible releases. The contaminants in the groundwater are measured using water samples collected from wells and sent for subsequent lab analysis. The practicalities and cost of this inevitably lead to irregularity in time and also in space, even when operating within a fixed set of sampling locations determined by the well positions. The data collection and assessment activity are generally undertaken by staff who have science or engineering backgrounds, but may not have had advanced training in statistical methods. However it is impractical that results should always be referred back to others for statistical analysis, and so there is a practical need for statistical tools that can be implemented easily and robustly as a routine part of the work of those environmental professionals. The analysis therefore needs to be fully automatic and fast to not only carry out but also to produce results, which are reliable, informative, and to aid robust project decision-making.

The aim of the present paper is to address these issues. In order to allow the construction of flexible models over space and time, P-splines are used because of their ability to provide compact representations and to express smoothness control in simple forms, as described in Section 2. A fully Bayesian spatiotemporal model is introduced in Section 3, using conjugate priors to avoid the need for MCMC implementation. In particular, the issue of selecting the degree of smoothness in the model is also addressed in order to produce a fully automatic procedure. A focus will be on issues of 'ballooning', where predictions can be high in areas where there are no data, and this is identified and addressed by appropriate choices of the number of basis functions and the type of smoothness penalty used. The need for speed is addressed through matrix decompositions, which enable the parameter that controls smoothness to be separated out from the computationally intensive parts of the calculation, along similar lines to those used by Ruppert *et al.* (2003), but also exploiting the sparsity of the design matrices associated with the spline basis.

2. SPATIOTEMPORAL SMOOTHING BY P-SPLINES

The P-spline approach to smoothing has become widely used because of its simplicity and its 'low rank' representation of the function of interest. In the simplest case where responses y_i and covariate values x_i are observed for a sample $i = 1, \ldots, n$, the model $y_i = m(x_i) + \varepsilon_i$ describes a flexible underlying relationship through the nonparametric regression function m whose form is unspecified beyond an assumption of smoothness. A basis approach assumes this function can be expressed through a linear combination $\sum_{j=1}^{p} \alpha_j \phi_j(x)$, where the functions $\phi_j(x)$ are usually taken to be B-splines (usually of order 3) because of their efficient construction from polynomial pieces. By modifying the values of the coefficients α_j, a huge range of smooth functions can be created by weighting the local P-spline basis functions, which are centred at a grid of values along the x-axis.

A simple method of extending this to the spatiotemporal setting, where data y_i are indexed over space (s_{1i}, s_{2i}) and time t_i, for $i = 1, \ldots, n$, is to express the regression function as $m(s_1, s_2, t) = \sum_j \sum_k \sum_l \alpha_{jkl} \phi_j(s_1) \phi_k(s_2) \phi_l(t)$, which corresponds to using the tensor product of the marginal B-spline bases. This uses a basis set, which is simply the product of all triples of the marginal basis functions over s_1, s_2 and t. This can be conveniently expressed in vector-matrix form as $\mathbf{Y} = \mathbf{B}\boldsymbol{\alpha} + \boldsymbol{\varepsilon}$, where $\boldsymbol{Y}$ and $\boldsymbol{\varepsilon}$ are vectors of response data and error terms, $\boldsymbol{\alpha}$ is the vector of parameters α_{jkl} and the design matrix $\mathbf{B}$ consists of the basis functions (columns) evaluated at each data point (rows). The design matrix $\mathbf{B}$ can be efficiently constructed through 'row-wise' Kronecker products of the marginal basis functions (Ugarte *et al.*, 2010; Lee and Durban, 2011). The marginal spline bases make use of equally spaced knots, as this simplifies the construction of the penalty that will be employed to regularise the spline coefficients. Tensor product splines are not the only spline-based approach for covering the spatial domain. One alternative method commonly used in this context (see e.g. Kammann and Wand, 2003) are thin-plate splines. The latter have the advantage that they can adapt to the spatial density of the data and thus may lead to a more efficient placement of the spline knots, however, at the expense of having to run an additional algorithm for their placement.

Although this model can be fitted by simple least squares, Eilers and Marx (1996) proposed to use a dense set of basis functions in conjunction with a penalty term to control the degree of smoothness in the estimate. Specifically, the parameter estimate is chosen to be the value of $\boldsymbol{\alpha}$ that minimises

$$\|\mathbf{y} - \mathbf{B}\boldsymbol{\alpha}\|^2 + \lambda \|\mathbf{D}\boldsymbol{\alpha}\|^2 \tag{1}$$

where the matrix $\mathbf{D}$ computes successive differences across the sequence of α_{jkl}'s in each of the three covariate dimensions. Second-order differences are often used. Large values of the smoothing parameter λ thereby induce smoothness in the values of $\boldsymbol{\alpha}$ and hence in the estimated function m. The solution for the basis coefficients is easily seen to be $\hat{\boldsymbol{\alpha}} = (\mathbf{B}^T\mathbf{B} + \lambda\mathbf{D}^T\mathbf{D})^{-1}\mathbf{B}^T\mathbf{y}$. The trace of the matrix $\mathbf{B}(\mathbf{B}^T\mathbf{B} + \lambda\mathbf{D}^T\mathbf{D})^{-1}\mathbf{B}^T$, which creates the fitted values from the data vector $\mathbf{y}$, is defined as the 'effective degrees of freedom' by analogy with standard linear models. This gives a more intuitive scale on which the smoothness of the estimate can be expressed. The details of these methods are described by Eilers and Marx (1996), Ruppert *et al.* (2003), Wood (2006) and many other authors. In particular, Lee and Durban (2011) and Ugarte *et al.* (2010) discuss P-splines in the spatiotemporal setting.

In all forms of flexible or nonparametric regression, the choice of the degree of smoothness for the estimator is a crucial one, and many authors have addressed this issue. Widely used approaches include cross-validation (CV) that, using spatiotemporal notation, chooses λ to minimise $\sum_{i=1}^{n} \{y_i - \hat{m}_{-i}(s_{1i}, s_{2i}, t_i)\}^2$, where the subscript $-i$ indicates that observation i is not included in the construction of the estimate. Generalised cross-validation (GCV) is a popular variation. Akaike's Information Criterion (AIC) and its variation Akaike information criterion (AICc), described by Hurvich and Tsai (1989), are also widely used as a means of balancing the goodness-of-fit of the model against

 © 2015 The Authors. *Environmetrics* Published by John Wiley & Sons, Ltd.

its complexity. The general thinking is that AICc is less affected by the under-smoothing to which AIC and cross-validation are sometimes prone. Another commonly used criterion is BIC. The details of all these methods are discussed by many authors, with Wood (2006) as a good starting point.

In the groundwater monitoring setting described in Section 1, the choice of the degree of smoothing is particularly important, as it needs to be implemented in an unsupervised, automatic setting. The panels in Figure 1 show the predicted concentrations at a single time snapshot from a dataset of benzene measurements, using a P-spline spatiotemporal model. The top-left panel shows the effects of using AICc in selecting the smoothness of the estimate. A troubling feature is that there are areas of high predicted values, which are not well supported by the observed data ('ballooning'). The top-right panel shows the results when four wells are omitted. Even though the four omitted wells recorded low concentrations, omitting them causes the unsupported peaks of the posterior distribution to disappear, indicating strong sensitivity of the results to particular observations. A further source of concern is that removing these wells changes the predictions in the immediate vicinity of the wells less than predictions further away. GCV and observation-based cross-validation suffer from the same problem. The results obtained by a Bayesian approach (shown in the bottom two rows) are much less sensitive to the removal of the four wells. The results for cross-validation depend on whether the well structure is used when omitting observations. This will be discussed in more detail in Sections 5 and 6. The single most important factor that causes this 'ballooning' is the design used for collecting the data. However, this design is typically imposed by external constraints and thus cannot be changed.

Another key contributing factor to the 'ballooning' problems is the choice of the number of basis functions used. The computational advantage of using splines over other methods such as kriging depends strongly on the number of basis functions. In almost all practical applications, this number is chosen by finding a reasonable compromise between run time and memory usage. This is not a problematic issue for one-dimensional or two-dimensional data where a moderate number of basis functions (say around 25) present little computational challenge. For spatiotemporal data however, using 25 basis functions for each dimension would result in having to perform expensive matrix operations on a $15,625 \times 15,625$ matrix, which in the context discussed here is not a realistic option.

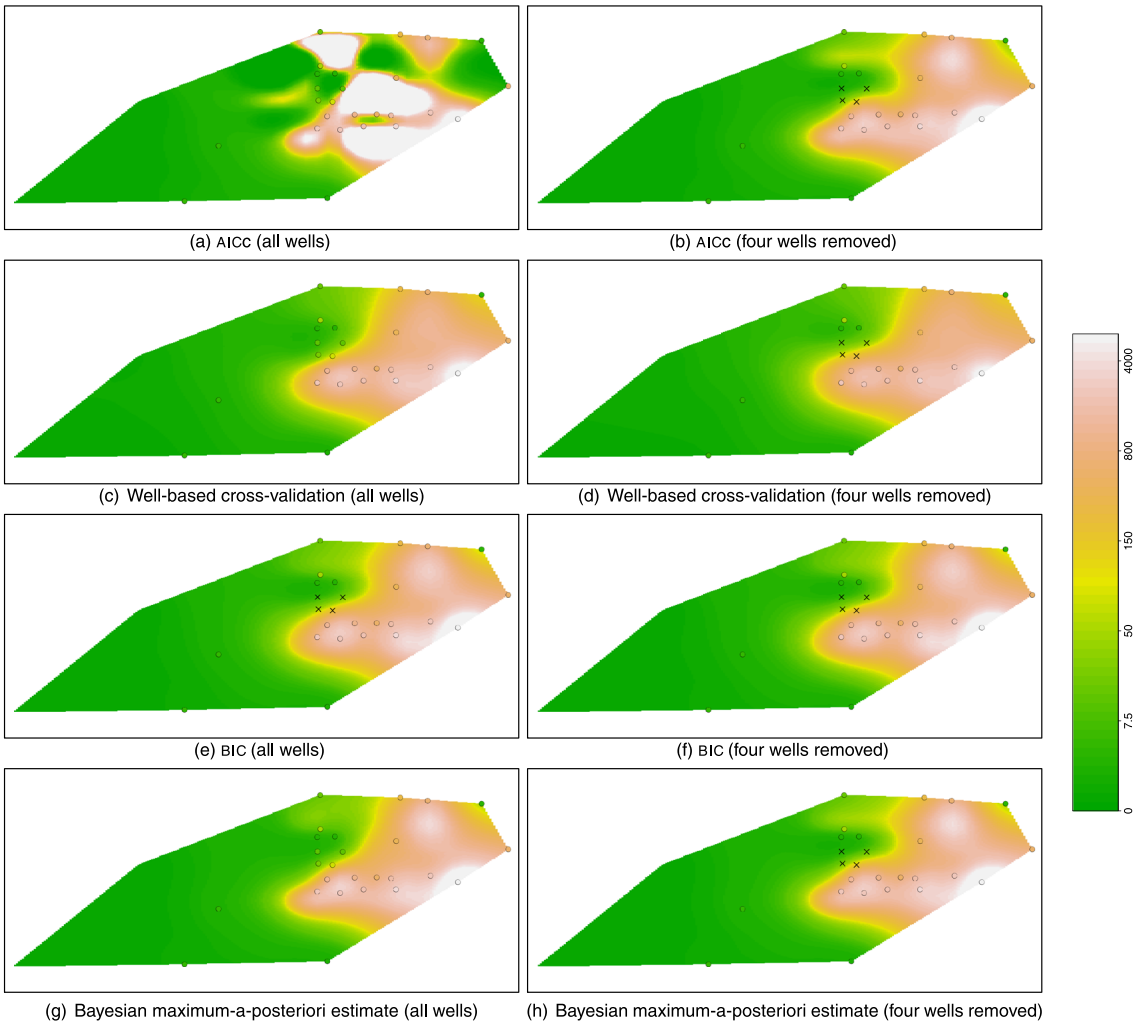

Figure 1. Predictions of the concentration (in $\mu g/\ell$) for the benzene data on one particular day (Section 6.1) using the penalisation parameter chosen by optimising the different criteria, as well as fully Bayesian model averaging. The left column was obtained by using all wells, the right column was obtained after removing four wells (marked by crosses). Using generalised cross-validation or observation-based cross-validation gives results very similar to AICc

 © 2015 The Authors. *Environmetrics* Published by John Wiley & Sons, Ltd.

In the context of spatiotemporal models, a low number of basis functions are usually chosen, and this raises the question of whether it is also necessary to use a penalty to induce smoothness, given that the low number of basis functions already offers some protection against over-fitting. The results discussed in Sections 5 and 6, however, show that using a penalty is especially important in this case, as it helps to prevent 'ballooning'.

The methods of selecting smoothness and the number of basis functions used are not the only factors in the appearance of this 'ballooning' effect of high and low values. The use of a second-order smoothness penalty encourages the appearance of linear sections, especially if there is a gap in the data, as these linear sections do not attract any penalty. Depending on the data around the gap, this can lead to a high peak or deep valley with little support from neighbouring observations. Using a first-order smoothness penalty typically lessens the problem to some extent, but is, on its own, often not enough to avoid 'ballooning' altogether. Choosing a different transformation of the response variable, such as the logarithm or the square root, can, depending on the data and the transform used, also have an effect.

There is a vast literature on the selection of the smoothing parameter for spline-based models in order to avoid over-fitting or under-fitting. The focus of this work is on the problem of 'ballooning', which is a different phenomenon.

3. BAYESIAN SPATIOTEMPORAL SMOOTHING

This section sets out how a Bayesian framework can be used to select the smoothing parameter. The starting point in the classical Bayesian linear model formulation (see e.g. Denison *et al.*, 2002) is adapted to the spatiotemporal setting. If the model determined by a particular value of the penalisation parameter λ is denoted by M_λ then, using the model described earlier, the likelihood function is derived from

$$\boldsymbol{Y}|\boldsymbol{\alpha}, \sigma^2, M_\lambda \sim \mathcal{N}\left(\boldsymbol{B}\boldsymbol{\alpha}, \sigma^2 \boldsymbol{I}_n\right)$$

with $\boldsymbol{Y} \in \mathbb{R}^n$, $\boldsymbol{B} \in \mathbb{R}^{n\times m}$ and $\boldsymbol{\alpha} \in \mathbb{R}^m$. For a fixed value of smoothing parameter, a conjugate prior for the parameters $\boldsymbol{\alpha}, \sigma^2$ is the normal-inverse gamma, that is,

$$\boldsymbol{\alpha}, \sigma^2 | M_\lambda \sim \mathcal{NIG}\left(\mathbf{0}, (\lambda \boldsymbol{D}'\boldsymbol{D})^{-1}, a, b\right)$$

In Sections 5 and 6, we use $a = b = 0.0001$ to acknowledge the uncertain prior information on the parameter σ^2.

The posterior distribution of the penalisation parameter λ can be shown to be

$$f_{M_\lambda|\boldsymbol{Y}} \propto \lambda^{\text{rank}(\mathbf{D}'\mathbf{D})/2} \frac{|\boldsymbol{B}'\boldsymbol{B} + \lambda \boldsymbol{D}'\boldsymbol{D}|^{-1/2}}{\left\{2b + \boldsymbol{y}'\left[\boldsymbol{I_n} - \boldsymbol{B}(\boldsymbol{B}'\boldsymbol{B} + \lambda \boldsymbol{D}'\boldsymbol{D})^{-1}\boldsymbol{B}'\right]\boldsymbol{y}\right\}^{a+n/2}} f^{\text{prior}}_{M_\lambda}$$

This is a special case of model comparison of Bayesian linear models, here using λ as the model index; for a general result see for example, Denison *et al.* (2002, equation 2.24, which gives the general principle for the comparison of Bayes factor). One difficulty in the present context is the degenerate nature of the prior for $\boldsymbol{\alpha}$, expressed in the rank deficiency of the differencing matrix $\mathbf{D}$. This can be handled by use of an additional ridge penalty, which gives the matrix $\mathbf{D}$ full rank. The posterior distribution shown earlier can be obtained by considering the limit as this ridge penalty goes to 0. Alternatively, it is possible to decompose the regression coefficients $\boldsymbol{\alpha}$ into two components, one of which has a flat improper prior and the other a proper Gaussian prior. This approach is discussed in more detail in the Appendix.

The main difference between this approach and the random-effects formulation of Ruppert *et al.* (2003) is that both the regression coefficients and the variance are handled in a Bayesian way, resulting in a fully Bayesian model.

In Sections 5 and 6, a non-informative improper uniform prior is used for f_{M_λ}. The value of λ that maximises this posterior density, known as the MAP (*maximum a posteriori*) value, is then adopted for penalisation. Additionally, a fully Bayesian approach, numerically integrating out the penalty parameter λ, is considered.

The use of conjugate priors is a computational convenience that addresses the need for fast computation, as MCMC or other solutions required for dealing with non-conjugate priors would be infeasible, given the time constraints which apply. Only when a conjugate prior is placed on $\boldsymbol{\alpha}$ and σ^2 is it possible to compute efficiently the marginal posterior probability of a given model M_λ. The proposed methodology works with any prior placed on M_λ. The flat prior used in Sections 5 and 6 is used for convenience. The results are however not sensitive to reasonable choices for the prior on M_λ.

4. COMPUTATIONAL ISSUES

Computation of the MAP distribution requires the determinant of the posterior covariance matrix of $\boldsymbol{\alpha}$ as well as the posterior residual sum of squares, which in turn requires computation of the penalised least-squares estimator minimising the objective function (1). The penalised least-squares estimator and the determinant have to be recomputed for every value of λ under consideration. This requires matrix operations, which are $O(p^3)$, where p is the number of regression parameters. For a spatiotemporal penalised spline model using p_0 basis functions in each dimension, we have $p \sim p_0^3$; thus, the cost of the matrix operations is $O(p_0^9)$

However, the problem can be rewritten (see e.g. Wood, 2000; Ruppert *et al.*, 2003) in such a way that the expensive linear algebra operations can be performed independently of λ, and only $O(p^2)$ operations have to performed for every value of λ. This allows the MAP solution to be computed much more efficiently.

Both the matrix of basis functions $\mathbf{B}$ and the differencing matrix $\mathbf{D}$ are sparse. Exploiting this sparseness allows further improvement in computational efficiency. However, for a trivariate P-spline problem with a moderate number of knots, the matrix $\mathbf{B}$ is much more dense

 © 2015 The Authors. *Environmetrics* Published by John Wiley & Sons, Ltd.

than the matrix **D**. For example, if 10 basis functions are used for each dimension, roughly 14% of the entries of **B** are non-zero, whereas less than 0.3% of the entries of **D** are non-zero. Sparsity can therefore be exploited most effectively by working initially only on the matrix **D**, in contrast to the approaches set out by Wood (2000) and Ruppert *et al.* (2003), which start by manipulating the matrix **B**. The approach set out in detail in the Appendix is loosely based on the method described by Eldén (1977). The core idea is to exploit the sparseness of the matrices for almost all matrix operations. However, each matrix decomposition creates 'in-fill', and so the matrices become increasingly dense. Only the final step, a singular value decomposition, is computed using dense methods. This implies that exploiting the sparsity of the design matrix and penalty matrix will not allow the implementation to become much more than twice as fast as the corresponding dense methods. However, in the context of this work, where the aim is to obtain results within less than a minute, this offers a significant increase in speed. In addition, exploiting the sparseness reduces the amount of memory used.

5. SIMULATION STUDY

In this section, a simple simulation study is used to compare the different methods of selecting the smoothing parameter in a systematic way. The data are simulated from a highly idealised model for the spread of a solute in water. This is based on the partial differential equation

$$\frac{\partial y}{\partial t} = D \cdot \left(\frac{\partial^2 y}{\partial s_1^2} + \frac{\partial^2 y}{\partial s_2^2} \right) + \psi_1(s_1, s_2) \frac{\partial y}{\partial s_1} + \psi_2(s_1, s_2) \frac{\partial y}{\partial s_2}$$

Here, y denotes the concentration of the solute, s_1 and s_2 denote the spatial coordinates and $t \in [0, 1]$ denotes time. The first term describes the spread of the solute in the groundwater by diffusion, with the constant D controlling how fast the solute spreads. The two further advection terms describe how the solute is affected by groundwater flow, whose direction and velocity is represented by the functions ψ_1 and ψ_2. These functions were chosen to correspond to the observed groundwater levels in the benzene example discussed in Section 6.1.

Figure S1(a) shows the assumed groundwater levels and flow, which in the simulations are assumed for simplicity to be constant over time, as well as the assumed initial spread of the solute and its evolution over time. The 'true' concentrations were obtained by interpolating the numerical solution to the differential equation, computed over a $100 \times 100 \times 100$ regular grid. Observed measurement data were generated by multiplicative Gaussian error terms, with standard deviation chosen to give a signal-to-noise ratio on the log-scale of 10 : 1. This reflects the fact that measurements of the solutes are usually quite accurate. A very small value of 0.05 was used for within-well correlation of the data, while the between-well correlation was assumed to be 0. Before the data were analysed, they were transformed using the function $\log(y + 1)$. The additive term was introduced because the simulations can produce concentrations of exactly 0. All model fitting and evaluation were performed on the transformed scale.

A P-spline model using second-order basis functions and a first-order penalty was used with 14 basis functions for easting, eight for northing and five for time. The different number of basis functions for space matches the different extents of the monitored region in easting and northing in the guiding example, while the reduced number of basis functions for time was chosen to reflect the fact that concentrations vary more quickly in space than in time. Addressing these issues through the basis functions allows a single smoothing parameter to be used in the model. Where little a priori information on solute behaviour is available, a natural default would be to choose a common number of basis functions in each dimension. The overall number of basis functions is deliberately chosen to be rather low to allow fast computations. Experimentation has shown these numbers of basis functions to be effective from this perspective, in addition to preventing 'ballooning' or over-fitting and producing good estimates of the underlying solute patterns.

Three different designs were used. The first scenario uses exactly the same well coordinates and sample dates as the benzene example discussed in Section 6.1. It consists of 1402 observations sampled at 29 well locations. The second scenario uses a much larger number of 280 randomly placed wells that are sampled much less frequently, resulting in the same number of observations. The second scenario is a much better design from a statistical point of view but is, of course, much more expensive, as establishing a new well is considerably more costly than collecting a sample from an existing one. The third scenario uses the same wells as the first scenario, but only has 100 observations in total, with each well sampled only about four times on average.

For all three scenarios, the methods were compared using the integrated squared error

$$\int \int_{\mathcal{S}} \int (\hat{m}(s_1, s_2, t) - m(s_1, s_2, t))^2 ds_1 ds_2 dt$$

The integral was computed numerically over the inside of the convex hull of the observed wells and sampling dates.

Table 1 shows the results obtained from 500 replications for all three scenarios. From the table, it is immediately clear that no one method outperforms all other methods for all three scenarios.

Out of the three scenarios presented, only scenario one is prone to 'ballooning'. In this situation, AICc and GCV show poor performance. These two criteria, as well as observation-based cross-validation, lead to severe 'ballooning'. The Bayesian approaches (BIC, MAP and model averaging) give much better performance, with no evidence of 'ballooning'. The predicted concentration surfaces obtained using the different criteria are given in Figure S2. Figure 2 (a) shows density strip plots (Jackson, 2008) of the distribution of the smoothing parameter λ for each method. This shows that the Bayesian approaches and well-based cross-validation select values of the smoothing parameter λ, which are large enough to prevent 'ballooning'. The problems with other methods are caused by values of λ, which are too low.

Although BIC performs very well if the focus is on preventing ballooning, it is prone to under-fitting. In the second scenario, which provides the 'best' data for estimating the concentrations, BIC performs significantly worse than the other methods. As Figure 2 (b) shows, this is because of selecting a value for λ, which is too large.

Table 1. Integrated squared errors of the predictions averaged over the convex hull of the data for the three well scenarios

Criterion used to select smoothness	Scenario 1		Scenario 2		Scenario 3	
	mean	(std. err.)	mean	(std. err)	mean	(std. err)
AICc	313.326	(258.319)	0.137	(0.003)	0.870	(0.009)
Generalised cross-validation	348.947	(276.003)	0.139	(0.001)	3.780	(2.282)
obs.-based CV	3.552	(0.216)	0.141	(0.001)	1.023	(0.016)
well-based CV	0.809	(0.012)	0.138	(0.001)	0.902	(0.012)
BIC	1.028	(0.013)	0.179	(0.001)	0.875	(0.003)
Bayesian MAP	1.662	(0.020)	0.136	(0.001)	0.863	(0.005)
Bayesian model avg.	1.639	(0.019)	0.136	(0.001)	0.858	(0.005)

In all three scenarios, the MAP and the fully Bayesian approach give good results, being the best method in the second and the third scenarios.

Cross-validation is, by far, the most computationally demanding method. In the simulations, and in Section 6, 10-fold cross-validation was used. The results depend on how the cross-validation is carried out. One option is to remove entire wells rather than single observations, and in this case, cross-validation favours very large values of the penalty parameter. In contrast, if the well structure is ignored and individual observations are removed, cross-validation favours very small values of the penalty parameter. The reason for the difference is that in this dataset, 'ballooning' occurs only in space and not in time. There is a small number of wells, and these are sampled very frequently in time. Omitting observations individually typically does not create gaps in time, which are large enough to allow 'ballooning' at individual wells. Cross-validation can therefore address 'ballooning' only if a well is omitted entirely. The difference between the two variants is much less pronounced in the second and third scenarios.

The proposed model can be extended by allowing two separate smoothing parameters, one for space and one for time. Only one of these tuning parameters can be tuned using the efficient linear algebra in Section 4. Tuning the second smoothing parameter requires recalculating all the matrix decompositions described in the Appendix for each candidate value of the second smoothing parameter, which significantly slows down the computations. However, when two smoothing parameters are used in scenario one, the temporal smoothing parameter is estimated to be around 20 times the spatial smoothing parameter. This might suggest that the use of a single smoothing parameter is inappropriate, but the models with two smoothing parameters are more likely to suffer from ballooning, leading to a poorer fit. If the ratio of the smoothing parameters is chosen to minimise the mean-square error on the test data, one would choose both smoothing parameters to be roughly equal, suggesting that a single smoothing parameter helps preventing ballooning and allows a more robust estimation of the concentration surface. This supports the use of a single smoothing parameter.

6. APPLICATION TO GROUNDWATER MONITORING

6.1. Monitoring of benzene in groundwater

Benzene (C_6H_6) is a constituent of crude oil and refined petrol, which can have serious adverse health (and ecological) effects if released into the environment. A release from an underground storage tank system can result in benzene contaminating the groundwater below the storage tank system. After such releases, networks of wells are set up to monitor possible groundwater contamination. The contaminant of interest is the concentration of benzene in $\mu g/\ell$ (modelled on a log-scale). The data consist of 1402 observations, which were obtained from a network of 29 wells, with considerable irregularity in the spatial and temporal spacing of the observations. A p-spline model using second-order basis functions and first-order difference penalties was fitted, with the smoothing parameter determined using different criteria. Different numbers of basis functions were chosen for the two spatial dimensions, with 18 for easting and 11 for northing, to reflect the different spatial extents in these directions. To reflect the fact that the level of spatial variation is expected to exceed the temporal variation, a smaller number (7) of basis functions were used for the time margin. The choice of the numbers of basis functions therefore provides a simple device for allowing appropriately differential degrees of smoothing in different dimensions, while retaining the very large computational advantage of a single overall penalty parameter.

Figure 3 depicts the choice of the optimal value of the penalty parameter for this example. In the case of the Bayesian MAP approach, the optimal choice is given by the value of λ, which maximises its posterior distribution. It is noticeable that AICc, GCV and observation-based cross-validation all lead to very low estimates of the smoothing parameter, which effectively 'switches off' the penalty, leading to 'ballooning'. BIC and well-based cross-validation select a much larger value of the smoothing parameter, preventing 'ballooning'. Using a fully Bayesian approach (MAP or full model averaging) results in a smoothing parameter, which is smaller than the one selected by BIC and well-based cross-validation but is still big enough to prevent 'ballooning'. The posterior distribution of λ is typically quite narrow, so using the MAP usually gives results very similar to a fully Bayesian treatment of the smoothing parameter, which involves averaging over λ. This is borne out in this example, as well as in the simulations in Section 5. As shown in Figure 1 and discussed in Section 2, the MAP is not sensitive to the removal of the four wells, shown as crosses in the right-hand column of plots. In contrast, the values chosen by AICc, GCV and observation-based cross-validation are highly sensitive, with removal of the wells resulting in a big change in the predictions with much more credible predicted concentrations. This highlights that the well design plays a key role.

6.2. Monitoring of methyl tertiary butyl ether in groundwater

A more extensive example of the use of these techniques is provided by retrospective analysis of a dataset on a pollution event at a refinery site. MTBE (methyl tertiary butyl ether) is a petrol additive designed to reduce engine knocking and noxious emissions. MTBE is no longer in routine use at the site studied but was present in the refinery at the time of the event. On entry to groundwater, MTBE moves conservatively because of its high aqueous solubility and low retardation potential. It degrades only slowly under anaerobic conditions. Figure 4 shows a schematic plan of the site with colour-coded points to indicate the concentrations of MTBE measured at the monitoring wells at a date near the time of the MTBE release. Standard methods of analysis in this setting were to inspect individual well measurements over time to identify trends. Geographical information systems were available and these were helpful for individual time snapshots but these could not easily be adapted to show the evolving dynamics of the incident. Figure 5 (and the earlier Figure 1) was created using the `rp.spacetime` function from the current version of the `rpanel` (Bowman *et al.*, 2007) package for `R` (R Development Core Team, 2011). This shows the estimated pollution surface at four time points using the Bayesian smoothing model described in Section 3, using 18 basis functions for easting, 22 basis functions for northing, 14 basis functions for time and the MAP estimate of λ. Despite the presence of protective pumping wells at the north–west boundary of the refinery site, the threat of MTBE migrating across the site boundary and potentially reaching drinking water wells required immediate action. The first time point shown in Figure 5 corresponds to the upgrading of a line of wells used to form a flow barrier in the middle of the site. The effectiveness of these wells was greatly improved, and the resulting curtailment of the plume to the north-west is apparent. Subsequently, the source of the MTBE release was identified near the south–east corner of the site, and the model clearly tracks the dissipation and attenuation of MTBE and the end of the incident. The shape and direction of the plume are clear and consistent with the south–east/north–west gradient in groundwater flow. Figure S4 shows the estimate of the time trend for four selected wells.

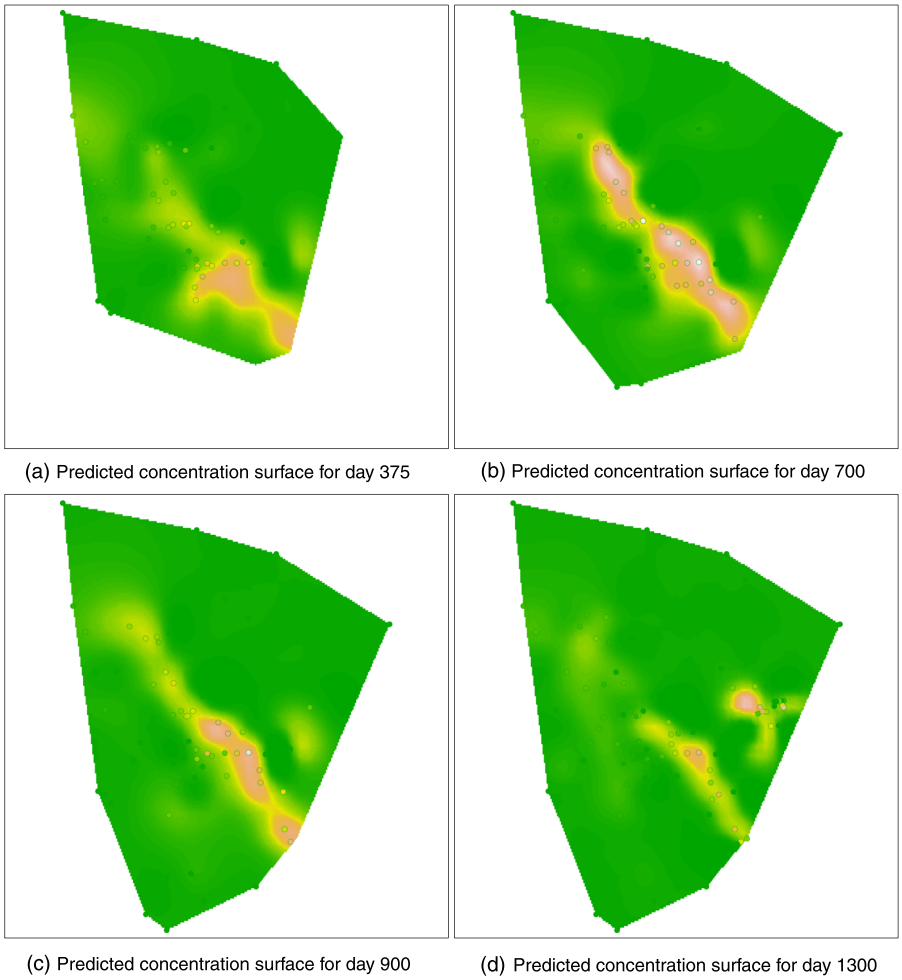

Figure 5. Predicted levels of methyl tertiary butyl ether concentration across space obtained using the maximum a posteori estimate of the smoothing parameter for four time points. The colour scale is the same as that used in Figure 4

In order to assess the effect of the number of basis functions, we have also investigated a model with fewer basis functions (14 basis functions for easting, 17 basis functions for northing and 10 basis functions for time) and a model with an increased number of basis functions (22 basis functions for easting, 26 basis functions for northing and 15 basis functions for time). The smaller model uses about half of the number of parameters of the model shown in Figures 5 and is about eight times faster, as suggested by the computational complexity of the final eigenvalue decomposition. The larger model has about twice as many parameters than the aforementioned model and takes about eight times as long to fit. The smaller model suffers from ballooning in the North East, whereas the larger model gives results similar to the model used. Plots of the estimated concentration surface obtained from these two models are available in Figure S5.

7. DISCUSSION

A fully automatic Bayesian framework for determining the smoothing parameter in spatiotemporal P-spline models has been proposed. The focus was on a situation where the key objective was to deliver, on a fast timescale, automatic and robust estimates of the distribution of a solute in groundwater and the corresponding plume geometry. In particular, there was a need to avoid spurious local extrema of the predictive surface with little support in the data ('ballooning'), which can sometimes occur in regions where the well design is sparse.

In our experience, and evidenced by the simulation study and the two real-world examples presented, the Bayesian methods studied are more stable than competing strategies based on criteria such as the AICc or GCV. While BIC is very good at avoiding 'ballooning', it can also lead to over-smoothing, to which the other Bayesian methods are less prone. If used appropriately, which is difficult to judge without prior knowledge, cross-validation can be very effective at preventing 'ballooning', but it has a rather high computational cost.

Although our focus was on spatiotemporal models, the methods can also be applied to other smoothing problems in which the use of a single smoothing parameter is appropriate, possibly after rescaling of parts of the penalty or adjustment of the number of basis functions.

The use of splines is not the only way of constructing spatiotemporal models for the contamination of groundwater. A particularly attractive alternative would be the use of a model based on the underlying physical processes. However, such models require a good understanding of the geology of the site, which in turn requires additional information that is not always readily available.

 © 2015 The Authors. *Environmetrics* Published by John Wiley & Sons, Ltd.

In our experience the problem of 'ballooning' is not limited to splines. 'Ballooning' can also occur when using other techniques such as kriging with a Matérn covariance. In the latter case, the severity of the problem of 'ballooning' depends on how the shape parameter of the covariance function is chosen, and also whether the data adhere to the implied assumptions of stationarity and isotropy. The P-spline based approach has the key advantage of not requiring the latter assumption.

The methodology set out above is implemented in GWSDAT, a fully automatic tool for the analysis of groundwater contaminants developed by Shell Global Solutions (Jones *et al.*, 2014).

APPENDIX A: COMPUTATIONAL DETAILS

Without loss of generality, we shall assume that $\mathbf{D}$ has full row rank. If not, replace $\mathbf{D}$ by the non-zero rows of $\mathbf{R}$ from a QR decomposition $\mathbf{D} = \mathbf{QR}$.

If the differencing matrix $\mathbf{D}$ is of full column rank, we could reparametrise the problem using $\tilde{\boldsymbol{\alpha}} = \mathbf{D}\boldsymbol{\alpha}$ yielding the ridge-regression problem

$$\mathbf{y}|\tilde{\boldsymbol{\alpha}} \sim \mathcal{N}(\mathbf{B}\mathbf{D}^{-1}\tilde{\boldsymbol{\alpha}}, \sigma^2\mathbf{I}), \qquad \tilde{\boldsymbol{\alpha}} \sim \mathcal{N}(\mathbf{0}, \sigma^2\lambda^{-1}\mathbf{I})$$

which can be solved independently of λ using a singular value decomposition (see e.g. Golub and Van Loan, 1996).

However, in P-spline problems, the matrix $\mathbf{D}$ does not have full column rank. Thus, we have to identify the subspace of the covariate space on which the penalty does not act. This can be carried out using a QR decomposition of $\mathbf{D}' = (\tilde{\mathbf{Q}}_1, \tilde{\mathbf{Q}}_2)\begin{pmatrix}\tilde{\mathbf{R}}_1\\ \mathbf{0}\end{pmatrix}$. Setting $\tilde{\boldsymbol{\alpha}}_1 = \tilde{\mathbf{R}}_1'\tilde{\mathbf{Q}}_1'\boldsymbol{\alpha}$, $\tilde{\boldsymbol{\alpha}}_2 = \tilde{\mathbf{Q}}_2'\boldsymbol{\alpha}$, $\tilde{\mathbf{B}}_1 = \mathbf{B}\tilde{\mathbf{Q}}_1\tilde{\mathbf{R}}_1'^{-1}$, $\tilde{\mathbf{B}}_2 = \mathbf{B}\tilde{\mathbf{Q}}_2$ and $\tilde{\mathbf{D}}_1 = \tilde{\mathbf{R}}'$ allows rewriting the problem as

$$\mathbf{y}|\tilde{\boldsymbol{\alpha}}_1, \tilde{\boldsymbol{\alpha}}_2 \sim \mathcal{N}(\tilde{\mathbf{B}}_1\tilde{\boldsymbol{\alpha}}_1 + \tilde{\mathbf{B}}_2\tilde{\boldsymbol{\alpha}}_2, \sigma^2\mathbf{I}), \qquad \tilde{\boldsymbol{\alpha}}_1 \sim \mathcal{N}(\mathbf{0}, \sigma^2\lambda^{-1}\mathbf{I}), \qquad p(\tilde{\boldsymbol{\alpha}}_2) \propto 1$$

This rotation of the variable space allows the regression coefficient to be split into two vectors: one, $\tilde{\boldsymbol{\alpha}}_1$, with a proper standard normal prior and one, $\tilde{\boldsymbol{\alpha}}_2$, with an improper flat prior. This can be interpreted as a mixed effects model, with $\tilde{B}_2$ being the design matrix of the fixed effects and $\tilde{B}_1$ being the design matrix of the random effects.

 © 2015 The Authors. *Environmetrics* Published by John Wiley & Sons, Ltd.

Finally, we perform a rotation of the observation space, such that the design matrix of $\tilde{\boldsymbol{\alpha}}_2$ only has l non-zero rows, where l is the length of the vector $\tilde{\alpha}_2$. This is achieved by computing the QR decomposition of $\tilde{\mathbf{B}}_2 = (\breve{\mathbf{Q}}_1, \breve{\mathbf{Q}}_2)\begin{pmatrix}\breve{\mathbf{R}}_1\\ \mathbf{0}\end{pmatrix}$.

Considering the response $\breve{\mathbf{y}} = (\breve{\mathbf{y}}_1', \breve{\mathbf{y}}_2')' = (\breve{\mathbf{Q}}_1, \breve{\mathbf{Q}}_2)'\mathbf{y}$ as well as setting $\breve{\mathbf{B}}_{11} = \breve{\mathbf{Q}}_1\tilde{\mathbf{B}}_1$, $\breve{\mathbf{B}}_{21} = \breve{\mathbf{Q}}_2\tilde{\mathbf{B}}_1$ and $\breve{\mathbf{B}}_{12} = \breve{\mathbf{Q}}_1\tilde{\mathbf{B}}_2$ yields the equivalent model assumption

$$\begin{pmatrix}\breve{\mathbf{y}}_1\\ \breve{\mathbf{y}}_2\end{pmatrix}\Bigg|\, \tilde{\boldsymbol{\alpha}}_1, \tilde{\boldsymbol{\alpha}}_2 \sim \mathcal{N}\left(\begin{pmatrix}\breve{\mathbf{B}}_{11} & \breve{\mathbf{B}}_{12}\\ \breve{\mathbf{B}}_{21} & \mathbf{0}\end{pmatrix}\begin{pmatrix}\tilde{\boldsymbol{\alpha}}_1\\ \tilde{\boldsymbol{\alpha}}_2\end{pmatrix}, \sigma^2\mathbf{I}\right)$$

with the same priors for $\tilde{\boldsymbol{\alpha}}_1$ and $\tilde{\boldsymbol{\alpha}}_2$ as aforementioned. The posterior distribution of $\tilde{\boldsymbol{\alpha}}_1$ and $\tilde{\boldsymbol{\alpha}}_2$ given $\breve{\mathbf{y}}$ is a normal distribution, with the penalised least-squares estimates $\widehat{\tilde{\boldsymbol{\alpha}}_1}$ and $\widehat{\tilde{\boldsymbol{\alpha}}_2}$ as mean and unscaled covariance matrix

$$\begin{pmatrix}\breve{\mathbf{B}}_{11}'\breve{\mathbf{B}}_{11} + \breve{\mathbf{B}}_{21}'\breve{\mathbf{B}}_{21} + \lambda\mathbf{I} & \breve{\mathbf{B}}_{11}'\breve{\mathbf{B}}_{12}\\ \breve{\mathbf{B}}_{12}'\breve{\mathbf{B}}_{11} & \breve{\mathbf{B}}_{12}'\breve{\mathbf{B}}_{12}\end{pmatrix}$$

Its determinant can be shown to be

$$\det(\breve{\mathbf{B}}_{21}'\breve{\mathbf{B}}_{21} + \lambda\mathbf{I}) \cdot \det(\breve{\mathbf{B}}_{12}'\breve{\mathbf{B}}_{12})$$

by using the Leibnitz formula and exploiting the fact that by construction, $\breve{\mathbf{B}}_{12}$ is invertible. The penalised least squares estimate can be found by exploiting the fact that the residual corresponding to $\breve{\mathbf{y}}_1$ can be set to $\mathbf{0}$ by setting

$$\widehat{\boldsymbol{\alpha}_2} = \breve{\mathbf{B}}_{12}^{-1}\left(\breve{\mathbf{y}}_2 - \breve{\mathbf{B}}_{11}\widehat{\tilde{\boldsymbol{\alpha}}_1}\right)$$

Thus, $\widehat{\tilde{\boldsymbol{\alpha}}_1}$ can be found by considering the reduced ridge regression problem involving only only the coefficient $\tilde{\boldsymbol{\alpha}}_1$:

$$\breve{\mathbf{y}}_2|\tilde{\boldsymbol{\alpha}}_1 \sim \mathcal{N}(\breve{\mathbf{B}}_{21}\tilde{\boldsymbol{\alpha}}_1, \sigma^2\mathbf{I}), \qquad \tilde{\boldsymbol{\alpha}}_1 \sim \mathcal{N}(\mathbf{0}, \sigma^2\lambda^{-1}\mathbf{I})$$

This is a ridge regression problem that can be solved using the singular value decomposition of $\breve{\mathbf{B}}_{21} = \mathbf{U}\mathbf{L}\mathbf{V}'$ yielding (see e.g. Golub and Van Loan, 1996)

$$\widehat{\tilde{\boldsymbol{\alpha}}_1} = \mathbf{V}\left(\frac{\mathrm{diag}(\mathbf{L}) \odot \mathbf{U}'\breve{\mathbf{y}}_2}{\mathrm{diag}(\mathbf{L})^2 + \lambda}\right)$$

where $\odot$ stands for element-wise multiplication and the fraction, sum and power are to be interpreted element-wise. The singular value decomposition can also be used to compute the determinant

$$\det(\breve{\mathbf{B}}_{21}'\breve{\mathbf{B}}_{21} + \lambda\mathbf{I}) = \det(\mathbf{L}'\mathbf{L} + \lambda\mathbf{I}) = \prod_i (L_{ii} + \lambda)$$

Up to the computation of the final singular value decomposition, all operations are performed by exploiting the sparse structure of the matrices, which allows the use of standard sparse matrix libraries. It is also worth noting that it is not necessary to compute a full Singular value decomposition (SVD). It is enough to tridiagonalise the matrix $\breve{\mathbf{B}}_{21}$ (see e.g. Eldén, 1977; Wood, 2000). Exploiting this allows to further speed-up the algorithm.

Document Title

Analyzing Groundwater Quality Data and Contamination Plumes with GWSDAT

Citation

Jones, W.R., Spence, M.J., and Bonte, M. (2015). *Analyzing Groundwater Quality Data and Contamination Plumes with GWSDAT*. *Groundwater*, 53(4), 513-514. DOI: 10.1111/gwat.12340.

Purpose of Inclusion

This document is provided as supporting technical literature describing the GroundWater Spatiotemporal Data Analysis Tool (GWSDAT) utilized in this Addendum.

The article summarizes GWSDAT functionality and discusses application of the software for:

- Groundwater monitoring data evaluation;
- Contamination plume characterization;
- Plume stability assessment;
- Spatiotemporal smoothing of groundwater concentration data;
- Evaluation of plume area, plume concentration, and plume mass metrics.

GWSDAT was used in this Addendum to evaluate arsenic occurrence within groundwater, develop plume maps, assess plume evolution, and calculate plume metrics discussed in Sections 5 and 7.

Analyzing Groundwater Quality Data and Contamination Plumes with GWSDAT

Wayne R. Jones[1], Michael J. Spence[2], and Matthijs Bonte[2]

The Groundwater Spatiotemporal Data Analysis Tool (GWSDAT) is a user-friendly, open source software tool used to analyze and report trends in groundwater quality monitoring data. GWSDAT is based on the open source statistical programming language R and Microsoft Excel. GWSDAT's primary use is for interrogation and interpretation of groundwater monitoring data derived from contaminated sites. It has specific functionality for analyzing dissolved-phase concentration and light nonaqueous phase liquid (LNAPL) thickness trends and spatiotemporal smoothing to delineate dynamic contamination plumes. The software can handle large data sets with multiple monitoring locations, variable sampling events, and differing chemical constituents. GWSDAT has been used extensively in the assessment of soil and groundwater conditions at numerous assets around the world, including retail and manufacturing sites. The following are key benefits and value-added features of GWSDAT:

- Improved data transparency to design and optimize groundwater monitoring or remediation programs;
- Early identification of new releases, migration pathways, the need for corrective action, and stable or declining trends that may aid in site closure determinations;
- Clarity on the relations between dissolved solute concentrations, LNAPL thicknesses, and groundwater elevation; and
- Rapid interpretation of complex data sets from large monitoring networks (e.g., refineries, terminals)

doi: 10.1111/gwat.12340

The main functionalities of GWSDAT include trend analyses, data smoothing, spatiotemporal smoothing, and determination of contamination plume characteristics. Groundwater quality observation data for individual monitoring points can be fitted to a linear or log linear regression model, where the significance of a trend can be determined by using the Mann-Kendall approach, which is widely used for trend detection in groundwater and surface water studies (Bouza-Deaño et al. 2008; Wahlin and Grimvall 2010). Groundwater concentration maps are developed by using a spatiotemporal solute concentration smoother derived from a penalized-splines nonparametric regression (Eilers and Marx 1996). The simultaneous statistical smoothing over space and time generally provides a more accurate, more consistent illustration of a contamination plume when compared against contour maps of individual sampling rounds (Cressie and Wikle 2011). In general, the spatiotemporally smoothed plume will be less biased by missing sampling rounds or missing data within sample rounds (Cressie and Wikle 2011). GWSDAT calculates a number of quantitative plume metrics by using the Ricker (2008) method describing the temporal plume behavior based on the contaminant mass of the plumes, average concentration, plume footprint area, and location of the center of mass. All of these are based on a spatial integration of the plume concentrations above a predefined concentration threshold. Further details on the input and output features of GSWDAT can be found in the supporting information (Appendixes S1 and S2). Additional information on each of the methodologies (including descriptions of the R packages used, but excluding the plume metrics, which are added in the latest version of GWSDAT) can be found in Jones et al. (2014).

Software Availability

- Hardware requirements: Standard PC 1 GB RAM or more, 32-bit or 64-bit processor.
- System requirements: Microsoft Windows (XP or later)
- Software requirements: R version 3.0.0 (www.r-project.org) or higher and Microsoft Excel 2003 or higher.

- Program size: 13 MB
- Availability: Free from www.claire.co.uk/GWSDAT and http://www.api.org/GWSDAT

Groundwater Spatiotemporal Data Analysis Tool: Case Studies, New Features and Future Developments

by Wayne R. Jones, Luc Rock, Alexandra Wesch, Emanuel Marzusch and Marnie Low

Abstract

Groundwater Spatiotemporal Data Analysis Tool (GWSDAT) is an open-source, user-friendly, software application for the visualization and interpretation of groundwater monitoring data. Since its first release, over 8 years ago, it has become increasingly well established and is now a globally adopted tool. Despite its widespread use, there is little published material considering the application of GWSDAT. The primary purpose of this article is to demonstrate the different benefits of using GWSDAT by considering a cross-section of real case studies. The first case study is an example of using GWSDAT to provide evidence to support a proposal to reduce sampling frequency. The next case study discusses the use of GWSDAT to support the recommendation for site closure. The third case study considers how GWSDAT can be used to identify gaps in a monitoring network. The final case study reports on the application of the, newly introduced, well redundancy analysis feature in GWSDAT. Finally, the road map for future developments in the optimization of monitoring network and the motivation for doing this in a spatiotemporal framework is discussed

Introduction

The GroundWater Spatiotemporal Data Analysis Tool (GWSDAT) is a user-friendly, open-source software tool used to analyze and report trends in standard groundwater quality monitoring data sets. It includes functionality to identify dissolved concentration trends and groundwater elevation fluctuations in individual wells together with the estimation of groundwater flow direction and strength. GWSDAT can also display light nonaqueous phase liquid (LNAPL) thickness trends. The most unique aspect of GWSDAT is the application of a spatiotemporal smoothing model where the spatial and temporal components of the solute concentration data are modeled jointly in a single modeling framework (Jones et al. 2014). This challenges industry convention where the most common practice is to apply a statistical model to separate monitoring events (e.g., Ricker 2008; Gong et al. 2014; Belkhiri et al. 2020) or apply a single spatial model to a data set consisting of multiple time steps within a certain time period (binning) (e.g., Aziz et al. 2003). McLean et al. (2019) demonstrated that the simultaneous statistical smoothing of both spatial and temporal components provides a clearer and more insightful interpretation of the groundwater monitoring site solute characteristics than would otherwise be gleaned from analyzing these two components separately. To the best of our knowledge, there is no other open-source "off-the-shelf" tool that use a spatiotemporal model for concentration data. The application of spatiotemporal modeling in recent literature is mostly applied to groundwater elevation rather than solute concentrations (e.g., Ruybal and Hogue 2019).

It has now been over 8 years since the first version of GWSDAT was made publicly available through the American Petroleum Institute (www.api.org/GWSDAT) and Contaminated Land Applications in Real Environments (www.claire.co.uk/GWSDAT) websites. Since then, it has continued to be maintained and developed as an open-source collaborative project between Shell plc and the University of Glasgow. The second major release included diagnostic tools to estimate plume mass, area, and average concentration through time (Ricker 2008; Jones et al. 2015). The third major release replaced the old graphical user interface with a web-based architecture which paved the way for the development of an online version (www.gwsdat.net). Users, most commonly for computational performance or data security reasons, can still opt for local installation. As well as a host of other updates, the most recent release (version 3.1) includes well redundancy analysis (http://gwsdat.net/gwsdat_manual/). This allows the user to conveniently

drop a well or a combination of wells from the analysis and investigate the resultant impact on the estimated site plume dynamics. The primary intent of this tool is to understand which wells may have the most influence and provide supporting evidence that the conclusions of the analysis would not be significantly different with the omission of certain wells.

Due to its open-source design, GWSDAT has now become a standard, globally adopted software application in the groundwater monitoring industry. GWSDAT has already been downloaded over 10,000 times and is used by many engineers, environmental regulators, and students around the world. While literature is available on the underlying GWSDAT methodology (Jones et al. 2014; Molinari 2014; Evers et al. 2015; Jones et al. 2015; McLean 2018), little is available on real examples where GWSDAT has been applied. A common feedback from new and more experienced users has been the lack of case studies illustrating the use/applicability of GWSDAT. The main purpose of this article is to address this imbalance and give details on several case studies. The concluding section of this article is dedicated to the future direction of GWSDAT.

Case Studies

GWSDAT provides a variety of options to assess spatial and temporal trends within a groundwater monitoring dataset. It allows to display groundwater flow direction and relative magnitude, generate spatial maps of concentration data at specified time intervals from day, to month, to quarter, to year. Plume diagnostics is another functionality offered, which shows the temporal evolution of plume mass, area, and average concentration over time. The newest functionality added in version 3.10 is well redundancy analysis, which allows the user to take out one or more than one well from the dataset and re-evaluate spatial and temporal trends based on the reduced dataset and compare it to the original complete dataset. Based on a review of 76 sites covering 10 different countries covering the continents of Asia, Africa, and Europe (data not included), it was determined that for the majority (>80%) of the sites GWSDAT is used for concentration trend and plume stability analysis, as expected based on the design of the software. For about 20% of the sites included in the review, GWSDAT was primarily used to assess groundwater flow direction. GWSDAT was also specifically used to support (1) optimization of sampling frequency in about 20% of the cases, (2) site characterization and sampling gap assessment in about 30% of the cases, and (3) optimization of the analytical suite in about 5% of the cases. This snapshot of GWSDAT usage across almost 80 sites from around the world highlights the versatility and applicability of GWSDAT to support groundwater investigations.

To illustrate the functionalities of GWSDAT, four case studies, based on anonymized data, are presented below covering small (e.g., retail) as well as large (e.g., depot) sites (Table 1). All sites used for the case studies are within a non-fractured siliciclastic geological setting. GWSDAT's applicability in fractured geological setting is limited. The tool does not consider preferential flow-pathways, which are critical to understand in a fractured setting. Nevertheless, in a fractured geological setting, GWSDAT can still provide an efficient tool (1) to assess temporal changes and threshold exceedances within individual wells and (2) to generate spatial maps using the scaled circle plot functionality to display observed solute concentrations at the various sampling locations, at the click of a button.

Case Study #1

The objective of using GWSDAT for case study #1 was to demonstrate plume stability with the aim to optimize the sampling frequency interval. Case study #1 is surrounded by residential and commercial land use and is located nearby surface water bodies. In the mid-1990's during a site investigation, an impact with primarily BTEX was observed, which was only partially remediated via soil excavation and replacement. In the early 2000's, groundwater monitoring was implemented, and additional field investigations for further site characterization and adjustments to the groundwater monitoring network were completed in following years. BTEX concentration in groundwater at this site are impacted by fluctuations in the groundwater level, and the source of the contamination is residual contamination in the unsaturated and saturated zones. Data have shown that the plume has migrated beyond the site boundary along the groundwater flow direction (Figure 1).

Groundwater sampling at this site ranged from quarterly to bi-annual in the past. After recent completion of bi-annual sampling at 17 locations, a change in sampling frequency to annual was proposed to the regulator based on observations related to the decrease in the BTEX plume over time. The recommendation of changing the sampling frequency, which was approved by the regulator, was supported through the

Table 1

Summary of case studies

Site #	Small (e.g., retail) or large (e.g., depot) site	Objective of using GWSDAT	Site setting	Geological setting
1	Small	Plume stability—optimization in sampling interval	Residential commercial	
2	Small	Plume reduction—close-out of groundwater monitoring	Residential commercial	*Siliciclastics * non-fractured
3	Small	Plume stability—gap in monitoring network, earlier adoption of tool	Residential commercial recreational	
4	Large	Well redundancy analysis	Industrial

use of GWSDAT to showcase the spatial–temporal evolution of the BTEX plume over time (Figure 1). A reduction in BTEX concentrations within the area of investigation can be observed over time. In addition, an assessment of the plume diagnostics functionality offered by GWSDAT also clearly indicated a decreasing benzene plume for a threshold value of 1 µg/L over time (Figure 2).

Case Study #2

Case study #2 falls within the category of a small site. It is in an area with residential and commercial land use, and near a drinking water protection zone. This site has been in operation for over 50 years. In the late 1990's, a site investigation determined an impact at this site by BTEX and TPH. Groundwater sampling was conducted for further site characterization, additionally, soil excavation and replacement were completed at the site. Residual BTEX contamination, however, remained at this site due to safety consideration during the remedial activities. This was documented based on verification samples taken along the excavated surfaces. Consequently, a hydraulic groundwater remediation technology was implemented for a few years. During a site investigation in the 2000's, elevated BTEX concentrations in soil and groundwater were detected, and the regulator requested further groundwater monitoring.

After completion of bi-annual sampling of groundwater at five locations over a 5-year period, it was recommended to stop the groundwater monitoring activities. Note that investigations and monitoring activities at this site go back more than 20 years. GWSDAT (Figure 3) was included in the data analysis and reporting to the regulator to demonstrate that there is no spread of the residual contamination, and that the pathway 'soil to groundwater' is not active. Within GWSDAT, it is possible to graphically represent the spatio-temporal plots using various plot types. In this case, the plot type "conc-terrain circles" was used to represent measured concentrations at each sampled well using scaled circles (Figure 3). This visual representation, obtained at the "click-of-a button" facilitated the communication to the regulator of the decreasing concentrations to below detection limit over time across the study area. After evaluation of the monitoring report, which included data over the last 5 years prior to stoppage in monitoring activities, the regulator approved of the recommendation.

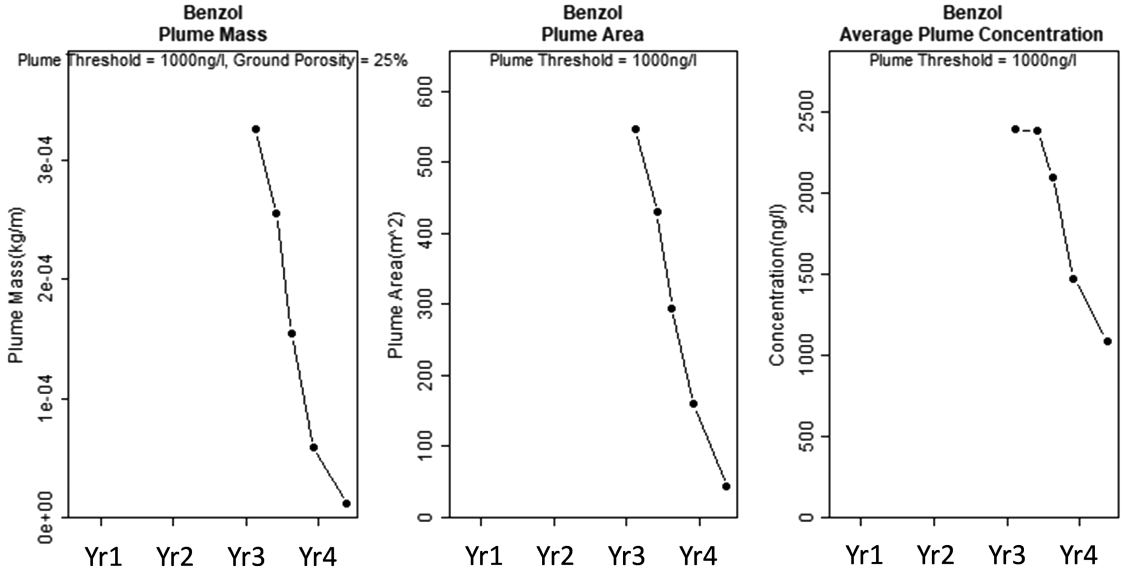

Figure 2. Plume diagnostics for benzene with a chosen threshold value of 1 µg/L at case study #1. Nb: Yr refers to year.

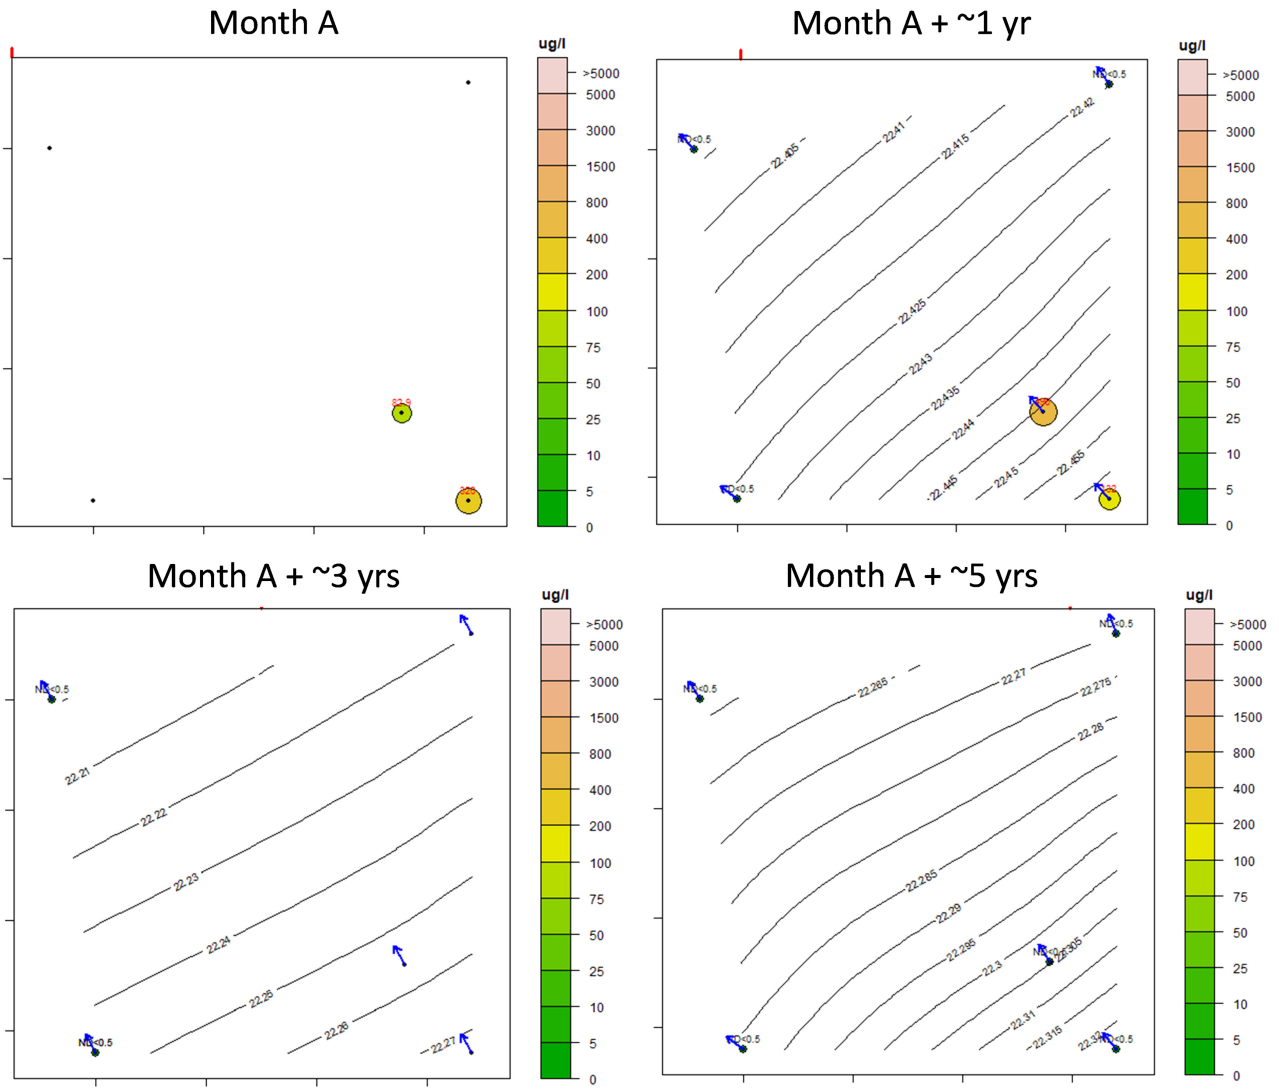

Figure 3. Time slices of the spatiotemporal plot (using plot type conc-terrain circles) showing historical BTEX concentration at case study site #2 over a five-year period. *Notes*: black dots represent well sampling locations; groundwater contours and groundwater flow direction at a specific well location also shown, no data on GW level were collected for data shown under "month A" plot. Size of circles scales with log of measured concentration with concentration range given in color key to right of graph.

Case Study #3

Similar to case studies #1 and #2, case study #3 refers to a small site. This site is surrounded by residential, recreational, and commercial land use. In the 1990's, several soil and groundwater investigations including remedial activities (such as soil excavation and replacement, as well as hydraulic measures) were undertaken at this site. Some residual contamination, however, remained at this site due to safety consideration during the remedial activities, like case studies #1 and #2. In the 2000's, additional site characterization work was completed in addition to installing new groundwater monitoring wells. Since about 2012, a regular groundwater monitoring program continued at this site to assess the evolution of TPH, BTEX, and MTBE concentrations in the monitoring wells. While groundwater monitoring data were collected over several years, GWSDAT was not part of the data interpretation workflow process for many years.

To illustrate the use of GWSDAT at this site for plume stability assessment, data for BTEX are presented covering a period of 8 years of groundwater monitoring data. Note that GWSDAT was used the first time when compiling the annual reporting for the groundwater monitoring events related to years 6 and 7 of the data presented in this case study. During compilation and assessment of the monitoring data from years 6 and 7, which integrated data from previous sampling campaigns, the following observation was made. While existing downstream wells (A, B) had no concentrations above the defined threshold, and were for almost every sampling event below the detection limit (Figure 4), there is a gap in the monitoring network in the downstream direction of groundwater flow. No wells were present in the downstream direction of wells C and D, which had concentrations above the defined threshold, especially well C (Figure 4). Two new wells were drilled, indicated by the red circles on Figure 4, during year 8, about a year after the first integration of GWSDAT in the data evaluation. The regulator agreed with the recommendation for the installation of additional groundwater monitoring wells. A sampling event after the installation of the additional groundwater monitoring wells indicated that BTEX concentrations in these wells were below detection limit (Figure 5). An evaluation of the GWSDAT spatiotemporal plots from years prior to year 8 predicted that concentrations would likely be below detection limit at the two

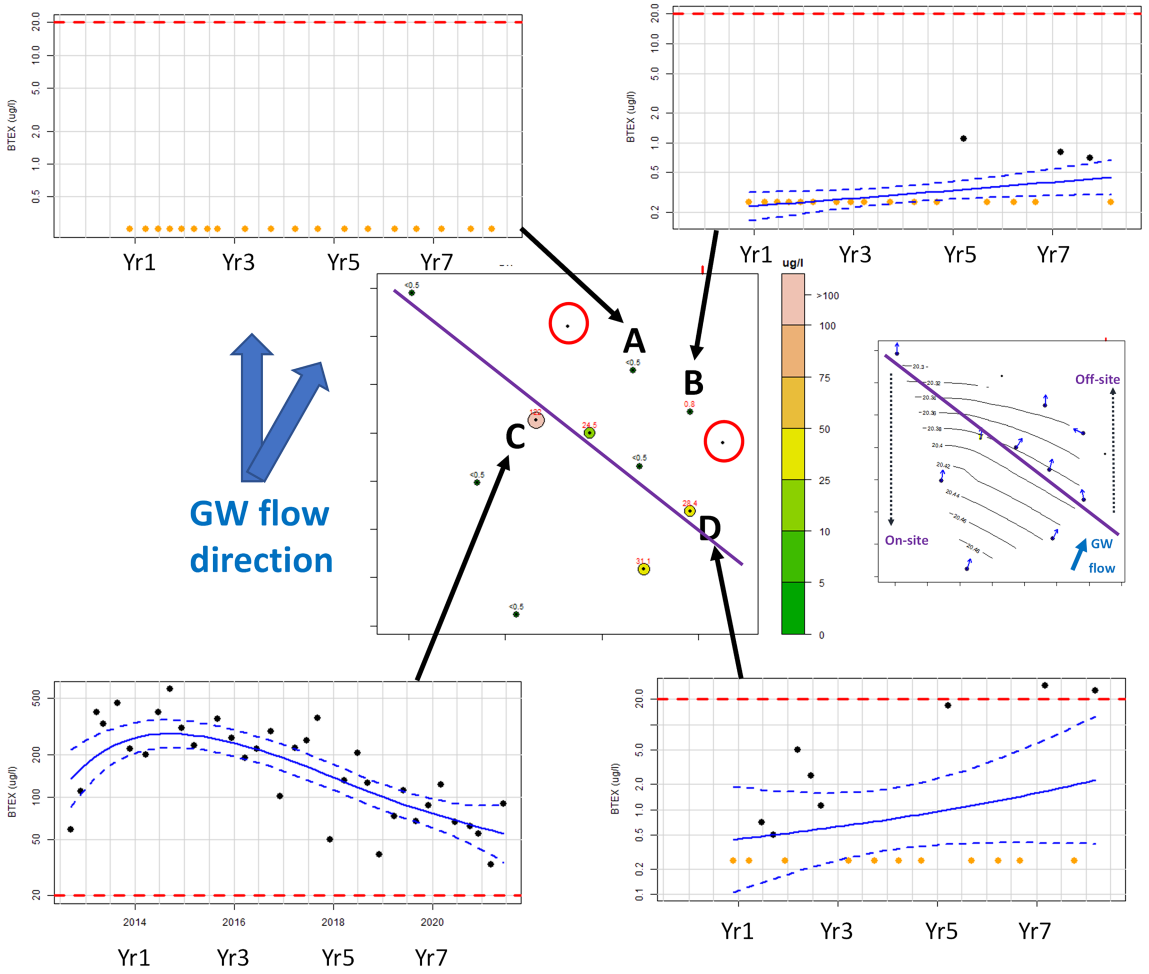

Figure 4. Time slice of spatiotemporal plot (using plot type conc-terrain circles, central plot) showing BTEX concentration including plots showing temporal evolution of concentrations at a select number of wells for case study site #2. Notes, temporal plots: red dashed line refers to user-defined value of threshold concentration value, black dots refer to actual measured concentration values, orange dots refer to non-detect data, blue solid line refers to concentration trend smoother values including upper and lower 95% confidence interval around the estimate (dashed blue line); spatial plot: purple solid line represents site boundary. Insert graph (middle right) shows groundwater contour and flow directions, including site boundary (purple solid line) and location of wells sampled (black dots).

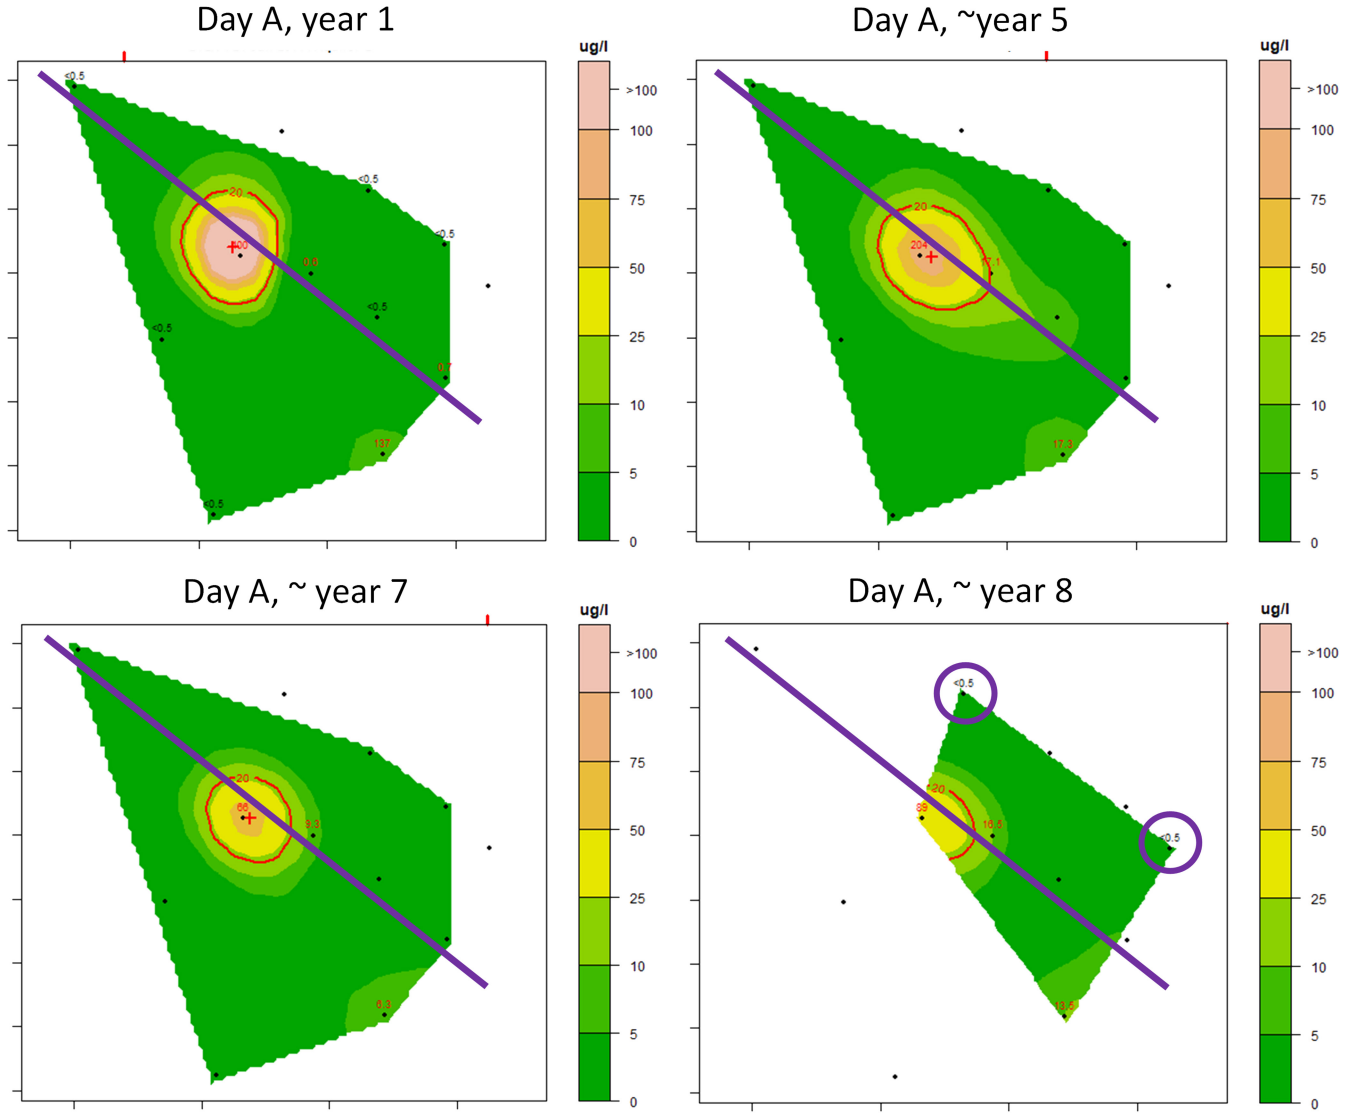

Figure 5. Time slices of the spatiotemporal plots showing historical BTEX plume evolution at case study site #3 over an eight-year period. Notes: red circle refers to predicted plume outline based on a threshold value of 20 µg/L; purple circles indicate location of two new monitoring wells installed in year 8 after evaluation of the monitoring results from years 6 and 7 with integration of monitoring results from previous years; Purple solid line represents site boundary (as per Figure 4 caption). GWSDAT predicted that concentrations in the two new wells will likely be below detection limit when looking at available historic data.

new locations chosen (Figure 5). Hence, this case study showcases that an earlier integration of GWSDAT could potentially have optimized site understanding and decision making around well sampling network and frequency earlier during the lifecycle of this project, which is still on-going. In future groundwater monitoring campaigns, GWSDAT will be an integral part of visualizing and assessing plume evolution/stability over time at this site. For instance, when using the plume diagnostic functionality, a clear trend of a decreasing BTEX plume at this site can be observed over time (Figure 6).

Case Study #4

The last case study presented in this paper relates to the application of the newly introduced well redundancy feature to a large monitoring site. This functionality allows the user to investigate the impact of omitting a well or a combination of wells and investigate the resultant impact on the estimated site plume dynamics. This is performed by independently applying the spatiotemporal smoothing model (Jones et al. 2014) to both the complete and the reduced solute concentration data sets and comparing the results. The site considered is in an industrial area and has been operational for several decades. Over the years, a few impacts to soil and groundwater have occurred, and a large network of groundwater monitoring wells exists at this site (several 10's of wells). To assess the effectiveness of the groundwater monitoring network, GWSDAT's new functionality of well redundancy analysis is being used. Three examples from this site will be presented below to cover the following two scenarios of groundwater well use:

- Scenario 1: Required wells for plume delineation
- Scenario 2: Redundant wells for plume delineation

At this site, groundwater is impacted by various CoPCs (constituents of potential concern). The examples provided here will be based on BTEX. Figure 7 provides an example

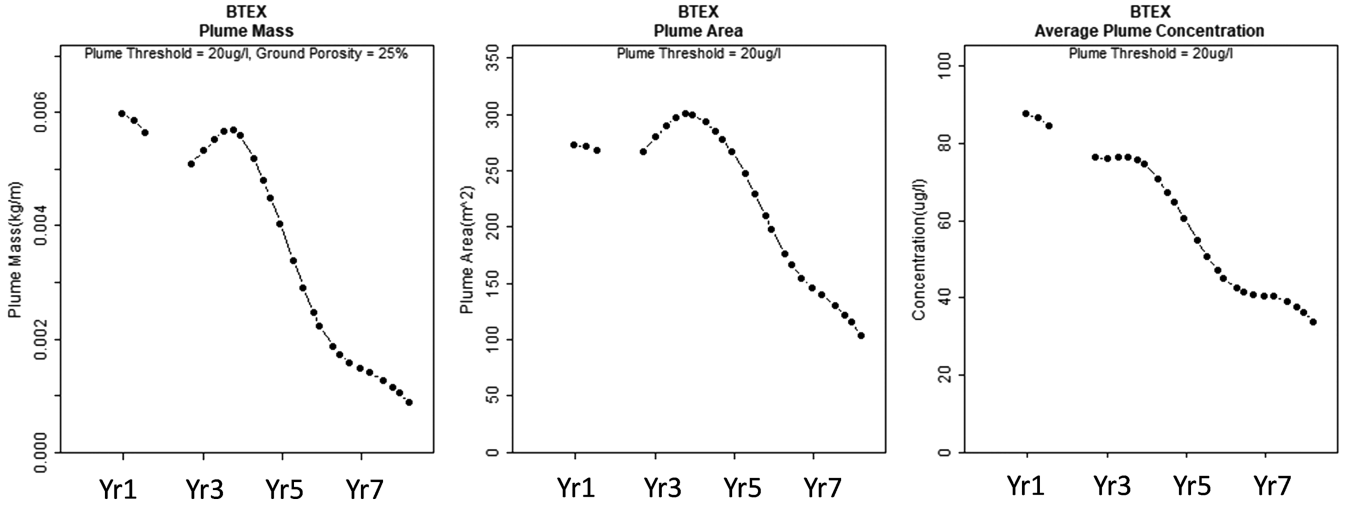

Figure 6. Plume diagnostics for BTEX with a chosen threshold value of 20 µg/L at case study #3. Nb: Yr refers to year.

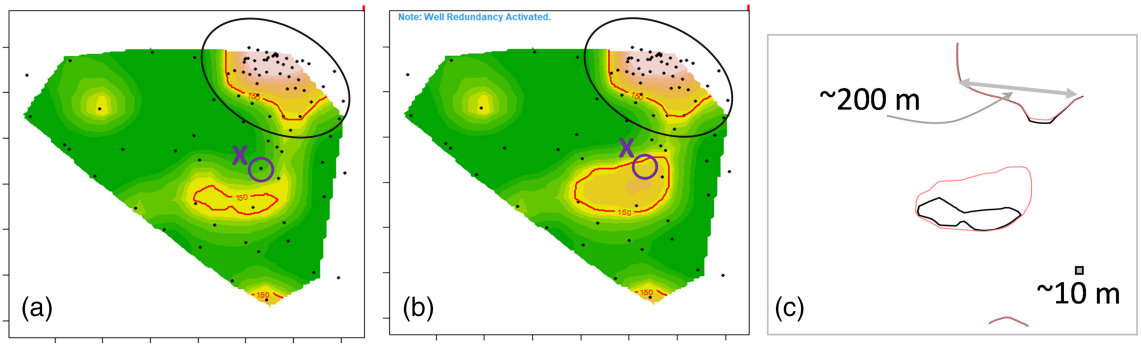

Figure 7. Time slices of a spatiotemporal plot for predicted BTEX plume delineation at case study site #4 with (a) all available data used in analysis and (b) with well redundancy functionality activated (well X removed from analysis). Red outlines show a user-chosen BTEX concentration contour to showcase. (c) Comparison of plume delineation outline (based on chosen concentration contour) for complete dataset (black line) versus reduced dataset (light red line). *Note*: black ellipsoid shows areal extent covered in Figure 8.

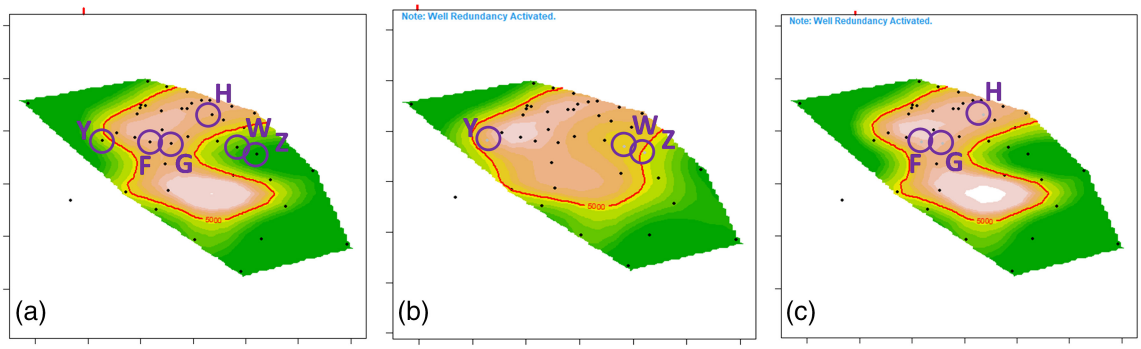

Figure 8. Time slices of a spatiotemporal plot for predicted BTEX plume delineation at case study site #4 with a) all available data used in analysis, and with well redundancy functionality activated for (b) wells Y, W, Z removed and (c) wells F, G, H removed from analysis). *Note*: red outline shows a user-chosen BTEX concentration contour to showcase the impact on plume delineation by removing wells from the data analysis; BTEX concentration below the user-chosen contour are shown in "yellow-green" colors, while concentration above are shown in orange to white colors.

of scenario 1. Figure 7a is a time-slice of the spatiotemporal model illustrating the modeled BTEX plume extent across a part of the site considering all wells available in the dataset. Figure 7b is a time-slice of the spatiotemporal model illustrating the modeled BTEX plume extent across a part of the site with the well redundancy functionality being active. As can be seen, removal of well X highlighted on the Figures 7a and b has a clear impact on the geometry of the plume.

For large sites, one needs to consider that at times there is a need to split the dataset into subsets. This is illustrated in Figure 8, which provides an example for scenario 1 (Figure 8b) and scenario 2 (Figure 8c). Figure 8 covers part of the area

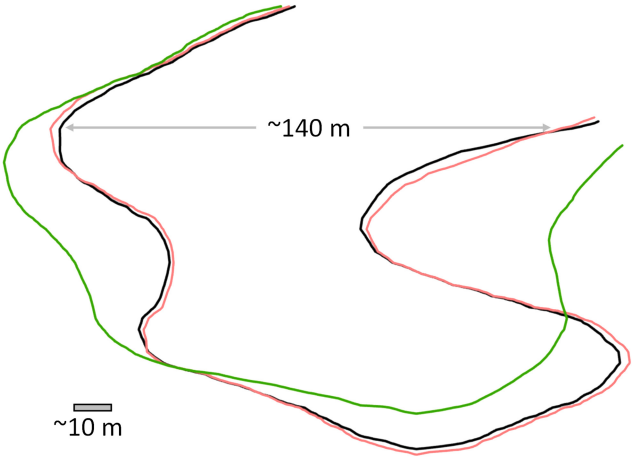

Figure 9. Comparison of plume delineation outline (based on user-chosen BTEX concentration contour) for complete dataset (black line) versus reduced datasets considered in Figure 8b (green line) and Figure 8c (light red line).

included in Figure 7 to get a more detailed understanding of the BTEX plume in that part of the site. A qualitative comparison between Figures 8a–c, highlights that wells Y, W, and Z are important for horizontal plume delineation at this site; while wells F, G, and H could potentially be removed from monitoring activities, as they have little impact on overall understanding of plume geometry (Figure 9).

Future Developments

The major area for future development is the addition of monitoring network optimization tools in GWSDAT. The aim is to support users to develop optimized groundwater monitoring strategies to create datasets that fully support site management decisions and requirements while minimizing exposure, time, and expense associated with collecting and interpreting data. Traditionally, within the environmental monitoring industry, network optimization decision support tools have predominantly been designed from either a spatial (e.g., kriging) or temporal perspective—see, for example, Aziz et al. (2003) and Cameron and Hunter (2002). These tools do not explicitly model the interaction effects across both spatial and temporal components. McLean et al. (2019) demonstrated that spatiotemporal modeling methods result in clearer more accurate plume estimations. This means that significantly smaller sample sizes can be used while retaining estimation accuracy. Hence, this observation together with the body of research in McLean (2018) provides a clear road map for additional integration of spatiotemporal network optimization tools into GWSDAT.

The well redundancy tool released in version 3.1 of GWSDAT, and illustrated in case study #4, is the first step on this journey of expanding GWSDAT's functionality for the application to network optimization. This functionality allows the user to conduct a "with and without" scenario analysis on a user-selected set of wells. Future versions will offer users more assistance by providing a list of wells ordered by an analytical assessment of which may be the most suitable for the omission. Going further forward, it is planned to complement well redundancy analysis with functionality to investigate the benefit of additional wells. This will involve optimally augmenting the existing network with new well locations such as to minimize the uncertainty in monitoring goals, for example, estimated plume extent, area, and mass.

The remaining piece of the road map to be implemented is decision support tools for efficient monitoring well sampling schemes which maximize information extraction while minimizing sampling effort. Once again, the literature in this area is primarily concerned with spatial design arguments, for example, Diggle and Lophaven (2006). The adoption of sampling design principles that accommodate the spatiotemporal nature of the data into GWSDAT will lead to even greater information extraction efficiency than that described in McLean et al. (2019). One such intuitive example of a spatiotemporal design is to sample, for instance, half of the wells spread out across the site for good spatial coverage in one sampling round and to sample the complement of these in the next sampling round. Such a design coupled with a spatiotemporal model would borrow and pool information from the combination of most recently sampled locations, both spatially and temporally, leading to good accuracy with reduced sampling effort.

Shell plc and the University of Glasgow continue to collaborate on developing new and innovative methodologies in the field of monitoring network optimization. Some aspects of this cutting-edge area of research are highly technical and consequently may not be immediately intuitive to understand as compared to, say, leave-well-out redundancy arguments. These techniques could therefore potentially be perceived as "black-box" in nature and lead to a lack of trust and consequently a lack of adoption by practitioners and regulators. To mitigate this risk the developers of GWSDAT plan to continue to work in an open manner and publish the underlying methodologies in peer-reviewed journals while always making the code open-source and completely transparent.

Acknowledgments

Biographical Sketches

Wayne R. Jones*, corresponding author, is a Principal Data Scientist with Shell Research Limited, London, UK. He is a chartered statistician with over 20 years of experience applying analytical solutions to industrial problems. He can be reached at Shell Centre, York Road, London, SE1 7NA, wayne.w.jones@shell.com.*

Luc Rock**, PhD,** *is a Senior Soil and Groundwater Scientist with Shell Global Solutions International B.V. supporting different business units. Prior to joining Shell, he worked in academia and a Canadian government research laboratory with a focus on understanding the origin and fate of compounds within the environment. He can be reached at the Shell Rijswijk office, Lange Kleiweg 40, 2288 GK, The Netherlands, luc.rock@shell.com.*

Alexandra Wesch *works as a project leader for Arcadis Germany GmbH. Her focus is on the assessment and remediation of soil and groundwater impacts. Before joining the Oil & Gas department of Arcadis in 2017, she completed her master's degree in geosciences with a focus on soil science at Leibniz University Hannover. She can be reached at the Arcadis Hannover office, Podbielskistraße, 30,659 Hannover, Germany, alexandra.wesch@arcadis.com.*

Emanuel Marzusch *has been working as a project engineer since 2017 with a focus on the assessment and remediation of soil and groundwater impacts. He completed his bachelor's and master's degree in geosciences with a focus on hydrogeology at the Friedrich-Wilhelms-Universität Bonn in 2017. He can reached at the Arcadis Darmstadt office, Europaplatz 3, 64,293 Darmstadt, Germany, emanuel.marzusch@arcadis.com.*

Marnie Low *is a Statistics lecturer at the University of Glasgow. Her primary area of research is spatiotemporal models for analyzing and optimizing groundwater quality monitoring networks. She can be reached at School of Mathematics and Statistics, University Place, Glasgow, G12 8TA, marnie.low@glasgow.ac.uk.*

RE: CWLP Borings **WorkOrder:** 24050235

Dear Eric Staley:

TEKLAB, INC received 4 samples on 5/2/2024 1:11:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Report Date: 28-May-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Receiving Check List

http://www.teklabinc.com/

Client: City Water, Light & Power
Client Project: CWLP Borings

Work Order: 24050235
Report Date: 28-May-24

Carrier: Paul Reeves
Received By: NR

Completed by: Amber Dilallo
On: 03-May-24

Reviewed by: Ellie Hopkins
On: 03-May-24

Pages to follow: Chain of custody 1 Extra pages included 14

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C 2.9
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice ☐
Chain of custody present?	Yes ☑	No ☐		
Chain of custody signed when relinquished and received?	Yes ☑	No ☐		
Chain of custody agrees with sample labels?	Yes ☑	No ☐		
Samples in proper container/bottle?	Yes ☑	No ☐		
Sample containers intact?	Yes ☑	No ☐		
Sufficient sample volume for indicated test?	Yes ☐	No ☑		
All samples received within holding time?	Yes ☑	No ☐		
Reported field parameters measured:	Field ☐	Lab ☐	NA ☑	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐		
When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.				
Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑	
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑	
Water - pH acceptable upon receipt?	Yes ☐	No ☐	NA ☑	
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑	

Any No responses must be detailed below or on the COC.

Samples requiring pH should be analyzed as soon as possible after collection. Samples submitted for pH analysis are analyzed as soon as practicable upon arrival at the laboratory. - amberdilallo - 5/3/2024 10:02:55 AM

Limited volume for D3 sample; additional volume for Radium-226 and -228 was submitted on WO#24050346. SAH 5/28/24

RE: 24050235

Dear Shelly Hennessy:

Order No.: 24050488

Summit Environmental Technologies, Inc. received 3 sample(s) on 5/7/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24050488**
Date: **5/23/2024**

CLIENT: TEKLAB Inc,
Project: 24050235

WorkOrder Narrative:
24050488: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **24050488**
Date: **5/23/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

RE: CWLP Borings **WorkOrder:** 24050346

Dear Eric Staley:

TEKLAB, INC received 10 samples on 5/3/2024 1:50:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power

Work Order: 24050346

Report Date: 05-Jun-24

Qualifiers

- Unknown hydrocarbon

B - Analyte detected in associated Method Blank

C - RL shown is a Client Requested Quantitation Limit

E - Value above quantitation range

H - Holding times exceeded

I - Associated internal standard was outside method criteria

J - Analyte detected below quantitation limits

M - Manual Integration used to determine area response

ND - Not Detected at the Reporting Limit

R - RPD outside accepted recovery limits

S - Spike Recovery outside recovery limits

T - TIC(Tentatively identified compound)

X - Value exceeds Maximum Contaminant Level

Client: City Water, Light & Power

RE: 24050346

Dear Shelly Hennessy:

Order No.: 24050783

Summit Environmental Technologies, Inc. received 10 sample(s) on 5/9/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24050783**
Date: **6/5/2024**

CLIENT: TEKLAB Inc,
Project: 24050346

WorkOrder Narrative:
24050783: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **24050783**
Date: **6/5/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: CWLP Borings **WorkOrder:** 24050428

Dear Eric Staley:

TEKLAB, INC received 2 samples on 5/6/2024 12:00:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

RE: 24050428

Dear Shelly Hennessy:

Order No.: 24050795

Summit Environmental Technologies, Inc. received 2 sample(s) on 5/9/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24050795**
Date: **5/28/2024**

CLIENT: TEKLAB Inc,
Project: 24050428

WorkOrder Narrative:
24050795: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **24050795**
Date: **5/28/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: CWLP Borings **WorkOrder:** 24050236

Dear Eric Staley:

TEKLAB, INC received 4 samples on 5/2/2024 1:11:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Definitions

Client: City Water, Light & Power
Work Order: 24050236
Client Project: CWLP Borings
Report Date: 29-May-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: 24050236

Dear Shelly Hennessy:

Order No.: 24050483

Summit Environmental Technologies, Inc. received 4 sample(s) on 5/6/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24050483**
Date: **5/22/2024**

CLIENT: TEKLAB Inc,
Project: 24050236

WorkOrder Narrative:
24050483: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Sample Fraction:
Per Chain of Custody note: Analyze Aqueous layer only.

Qualifiers and Acronyms

WO#: **24050483**
Date: **5/22/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

Comments: **Please Issue reports and invoices via email only**
Please analyze for Radium 226/228 per your usual methods.
Any changes to analysis/methods must be approved by Teklab, Inc. Batch QC is required.
Samples collected from an IL site. Analyze aqueous layers only.

Contact: Shelly Hennessy Email: shennessy@TekLabInc.com
Requested Due Date: Standard TAT Billing/PO: 36223 Phone: (618) 344-1004 ext. 36

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

RE: CWLP Borings **WorkOrder:** 24050347

Dear Eric Staley:

TEKLAB, INC received 3 samples on 5/3/2024 1:50:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power

Client Project: CWLP Borings
Report Date: 23-May-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: 24050347

Dear Shelly Hennessy:

Order No.: 24050485

Summit Environmental Technologies, Inc. received 3 sample(s) on 5/7/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24050485**
Date: **5/22/2024**

CLIENT: TEKLAB Inc,
Project: 24050347

WorkOrder Narrative:
24050485: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence QC Notes:
LCS/LCSD-75217 Radium-228_DW(904.0): LCS and LCSD exhibited a high RPD, individually each LCS/LCSD meets the required criteria.

Qualifiers and Acronyms

WO#: **24050485**
Date: **5/22/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

RE: CWLP Borings **WorkOrder:** 24050429

Dear Eric Staley:

TEKLAB, INC received 1 sample on 5/6/2024 12:00:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Report Contents

Client: City Water, Light & Power
Client Project: CWLP Borings

Work Order: 24050429
Report Date: 18-Jun-24

This reporting package includes the following:

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	6
Laboratory Results	7
Receiving Check List	8
Chain of Custody	Appended

Client: City Water, Light & Power **Work Order:** 24050429

Client Project: CWLP Borings **Report Date:** 18-Jun-24

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Definitions

Client: City Water, Light & Power
Work Order: 24050429
Client Project: CWLP Borings
Report Date: 18-Jun-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: 24050429

Dear Shelly Hennessy:

Order No.: 24050786

Summit Environmental Technologies, Inc. received 1 sample(s) on 5/9/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24050786**
Date: **6/18/2024**

CLIENT: TEKLAB Inc,
Project: 24050429

WorkOrder Narrative:
24050786: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **24050786**
Date: **6/18/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

Ecological and Flood Risk Documentation

HANSON

MEMORANDUM

Date: 4/30/2025
To: Matt Heyen, Hanson
From: Preston Marucco, Hanson
Project No.: 19E0107
Project Name: City Water, Light and Power (CWLP) Dallman FGD Waste Water Treatment
Subject: Sugar Creek Habitat Assessment
Copy to File, Others:

The Endangered Species Act (ESA) (16 U.S.C. 1531-1544) establishes protections for fish, wildlife, and plants that are listed as threatened or endangered. The law, among other things, prohibits any action that causes a "taking" of any listed species of endangered fish or wildlife. The ESA defines the term "take" as harassment, harm, pursuit, hunting, shooting, wounding, killing, trapping, capturing, collecting, or attempting to engage in any such conduct.

Hanson Professional Services Inc. (Hanson), at the direction of CWLP, performed a habitat assessment of Sugar Creek and adjacent riparian areas. The purpose of this assessment was to determine the presence of preferred habitat for threatened and endangered species known or expected to occur in or near the project area based on database records including the United States Fish and Wildlife Service's (USFWS's) Information for Planning and Consultation (IPaC) and the Illinois Department of Natural Resource's (IDNR's) Ecological Compliance Assessment Tool (EcoCAT).

Preliminary Habitat Assessment

On April 16, 2025, Hanson performed a preliminary habitat assessment of Sugar Creek and adjacent riparian and wetland areas to determine the presence of suitable habitat for federally- and state-listed threatened and endangered species (**see attached Location Map**). The length of Sugar Creek along the western limits of the study area was walked and photographed, and areas of potentially suitable habitat for federally- and state-listed species were documented and inventoried. Sugar Creek is a perennial stream occurring along the western limits of the study area and was determined to have an ordinary high water mark (OHWM) depth of 5.5 feet and width of 50 feet. The substrate of the creek consisted of mostly silt with some interspersed gravel and the stream displayed riffling and pooling in shallower areas. Live fish including grass carp (*Ctenopharyngodon Idella)* and shortnose gar (*Lepisosteus platostomus)* were observed in the stream. Turtles of unknown species were also observed. The stream was determined to have little canopy cover for the length of the project area with dominant tree species including American sycamore (*Platanus occidentalis)*, eastern cottonwood (*Populus deltoides),* white oak (*Quercus alba*), and American elm (*Ulmus americana*). The riparian plant community surrounding the stream was dominated by common reed (*Phragmites australis),* reed canary grass (*Phalaris arundinacea*) and Morrow's honeysuckle (*Lonicera morrowii)*. The banks of the stream ranged from shallow to steep slopes with most the bank along the length of the project area being a sheer drop off of about 6 feet from top of slope to water. Stone riprap has been placed along much of the shallower sloped bank areas to prevent erosion, which has inhibited

plant communities from growing in these areas. Several apparent wetland areas were observed along the riparian zone of Sugar Creek, but delineation of wetland boundaries was not performed.

Database Records - IPaC

The USFWS's IPaC tool was utilized to determine the potential presence of federally-listed threatened or endangered species within the project area, and species that may not occur within the project area but may be affected directly or indirectly by project activities. IPaC did not identify any critical habitats within or near the project area. **Table 1** lists species identified by IPaC as having potential to be affected by project activities and their associated listing status.

Table 1: IPaC Listings

Species	Scientific Name	Status
Indiana bat	*Myotis sodalis*	Endangered
Eastern prairie fringed orchid	*Platanthera leucophaea*	Threatened

Indiana Bat

The Indiana bat is a small, migratory bat species that forages on insects and utilizes caves and mines in the winter months to hibernate in colonies. According to information provided by the USFWS, the Indiana bat requires forested areas for foraging, roosting and reproduction in the summer months. Reproductive females roost in forested areas utilizing exfoliating bark of dead or dying trees that exhibit large slabs of peeling bark (i.e., oaks, ash, hickory). Maternity roosts typically occur in riparian zones, bottomland and floodplain habitats; and they prefer areas near running water.

Based on this information and a field assessment completed on April 16, 2025, riparian areas surrounding Sugar Creek present suitable habitat to support the Indiana bat's spring and summer roosting and maternity needs. No bats were observed during the field assessment.

Eastern Prairie Fringed Orchid

The eastern prairie fringed orchid is a perennial tuberous-rooted plant with creamy white flowers. According to information provided by the USFWS, this plant occurs in a wide variety of habitats including wet to mesic prairies and other wet or seasonally wet habitats. The plant requires full sun for optimal growth, but can also be located along the edge of, or interspersed among more densely vegetated plant communities. Early- or mid- successional sedge meadow and marsh habitats are the preferred habitat for this species because they provide reduced competition from established plants and sunlight exposure.

Based on this information and a field assessment completed on April 16, 2025, riparian and early-successional wetland areas surrounding Sugar Creek present suitable habitat to support the lifecycle of this species. No eastern prairie fringed orchids were observed during the field assessment.

Database Records – EcoCAT

The IDNR's EcoCAT tool was utilized to determine the potential presence of state-listed threatened or endangered species within the project area, and species that may not occur within the project area but may be affected directly or indirectly by project activities. EcoCAT did not identify any critical habitats within or near the project area. **Table 2** lists species identified by

EcoCAT as having potential to be affected by project activities and their associated listing status.

Table 2: EcoCAT Listings

Species	Scientific Name	Status
Kirtland's snake	*Clonophis kirtlandi*	State threatened

Kirtland's Snake

The Kirtland's snake is a snake averaging 14 to 18 inches in length with a red belly and a row of round, black spots down each of its sides. The dorsal portion of the snake is gray or brown with four rows of black blotches that may be difficult to discern. According to information provided by the IDNR, this snake is aquatic, but can often be found on land in or near wet meadows and swamps, or in areas adjacent to these habitat types. During the day the snake often utilizes rocks or hillside burrows for cover to hide. The species mates in May and females typically give birth in August or September.

Based on this information and a field assessment completed on April 16, 2025, Sugar Creek and adjacent wetland and riparian areas present suitable habitat to support the lifecycle of this species. No Kirtland's snakes were observed during the field assessment.

Summary

This summary is based on information provided by the USFWS's IPaC and IDNR's EcoCAT assessment tools and information gathered during an April 16, 2025 field assessment. Hanson has determined that suitable habitat for the federally-listed Indiana bat (endangered) and eastern prairie fringed orchid (threatened), as well as the state-listed Kirtland's snake, is present within and surrounding Sugar Creek.

Disclaimer

The Illinois Natural Heritage Database cannot provide a conclusive statement on the presence, absence, or condition of natural resources in Illinois. This review reflects the information existing in the Database at the time of this inquiry, and should not be regarded as a final statement on the site being considered, nor should it be a substitute for detailed site surveys or field surveys required for environmental assessments. If additional protected resources are encountered during the project's implementation, compliance with applicable statutes and regulations is required.

Terms of Use

By using this website, you acknowledge that you have read and agree to these terms. These terms may be revised by IDNR as necessary. If you continue to use the EcoCAT application after we post changes to these terms, it will mean that you accept such changes. If at any time you do not accept the Terms of Use, you may not continue to use the website.

1. The IDNR EcoCAT website was developed so that units of local government, state agencies and the public could request information or begin natural resource consultations on-line for the Illinois Endangered Species Protection Act, Illinois Natural Areas Preservation Act, and Illinois Interagency Wetland Policy Act. EcoCAT uses databases, Geographic Information System mapping, and a set of programmed decision rules to determine if proposed actions are in the vicinity of protected natural resources. By indicating your agreement to the Terms of Use for this application, you warrant that you will not use this web site for any other purpose.

2. Unauthorized attempts to upload, download, or change information on this website are strictly prohibited and may be punishable under the Computer Fraud and Abuse Act of 1986 and/or the National Information Infrastructure Protection Act.

3. IDNR reserves the right to enhance, modify, alter, or suspend the website at any time without notice, or to terminate or restrict access.

Security

EcoCAT operates on a state of Illinois computer system. We may use software to monitor traffic and to identify unauthorized attempts to upload, download, or change information, to cause harm or otherwise to damage this site. Unauthorized attempts to upload, download, or change information on this server is strictly prohibited by law.

Unauthorized use, tampering with or modification of this system, including supporting hardware or software, may subject the violator to criminal and civil penalties. In the event of unauthorized intrusion, all relevant information regarding possible violation of law may be provided to law enforcement officials.

Privacy

EcoCAT generates a public record subject to disclosure under the Freedom of Information Act. Otherwise, IDNR uses the information submitted to EcoCAT solely for internal tracking purposes.

IPaC **U.S. Fish & Wildlife Service**

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

Sangamon County, Illinois

Local office

Illinois-Iowa Ecological Services Field Office

(309) 757-5800
(309) 757-5807

Illinois & Iowa Ecological Services Field Office
1511 47th Ave

Moline, IL 61265-7022

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

---

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).
2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

NOT FOR CONSULTATION

The following species are potentially affected by activities in this location:

Mammals

NAME	STATUS
Indiana Bat Myotis sodalis Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/5949	Endangered

Birds

NAME	STATUS
Whooping Crane Grus americana No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/758	EXPN

Insects

NAME	STATUS
Monarch Butterfly Danaus plexippus Wherever found There is **proposed** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/9743	Proposed Threatened
Western Regal Fritillary Argynnis idalia occidentalis Wherever found No critical habitat has been designated for this species.	Proposed Threatened

Flowering Plants

NAME	STATUS
Eastern Prairie Fringed Orchid Platanthera leucophaea Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/601	Threatened

NOT FOR CONSULTATION

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

There are no critical habitats at this location.

You are still required to determine if your project(s) may have effects on all above listed species.

Bald & Golden Eagles

Bald and Golden Eagles are protected under the Bald and Golden Eagle Protection Act [2] and the Migratory Bird Treaty Act (MBTA) [1]. Any person or organization who plans or conducts activities that may result in impacts to Bald or Golden Eagles, or their habitats, should follow appropriate regulations and consider implementing appropriate avoidance and minimization measures, as described in the various links on this page.

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide avoidance and minimization measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

There are Bald Eagles and/or Golden Eagles in your project area.

Measures for Proactively Minimizing Eagle Impacts
For information on how to best avoid and minimize disturbance to nesting bald eagles, please review the National Bald Eagle Management Guidelines. You may employ the timing and activity-specific distance recommendations in this document when designing your project/activity to avoid and minimize eagle impacts. For bald eagle information specific to Alaska, please refer to Bald Eagle Nesting and Sensitivity to Human Activity.

NOT FOR CONSULTATION

The FWS does not currently have guidelines for avoiding and minimizing disturbance to nesting Golden Eagles. For site-specific recommendations regarding nesting Golden Eagles, please consult with the appropriate Regional Migratory Bird Office or Ecological Services Field Office.

If disturbance or take of eagles cannot be avoided, an incidental take permit may be available to authorize any take that results from, but is not the purpose of, an otherwise lawful activity. For assistance making this determination for Bald Eagles, visit the Do I Need A Permit Tool. For assistance making this determination for golden eagles, please consult with the appropriate Regional Migratory Bird Office or Ecological Services Field Office.

Ensure Your Eagle List is Accurate and Complete

If your project area is in a poorly surveyed area in IPaC, your list may not be complete and you may need to rely on other resources to determine what species may be present (e.g. your local FWS field office, state surveys, your own surveys). Please review the Supplemental Information on Migratory Birds and Eagles, to help you properly interpret the report for your specified location, including determining if there is sufficient data to ensure your list is accurate.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to bald or golden eagles on your list, see the "Probability of Presence Summary" below to see when these bald or golden eagles are most likely to be present and breeding in your project area.

Review the FAQs

The FAQs below provide important additional information and resources.

NAME	BREEDING SEASON
Bald Eagle Haliaeetus leucocephalus This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.	Breeds Oct 15 to Aug 31

NOT FOR CONSULTATION

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

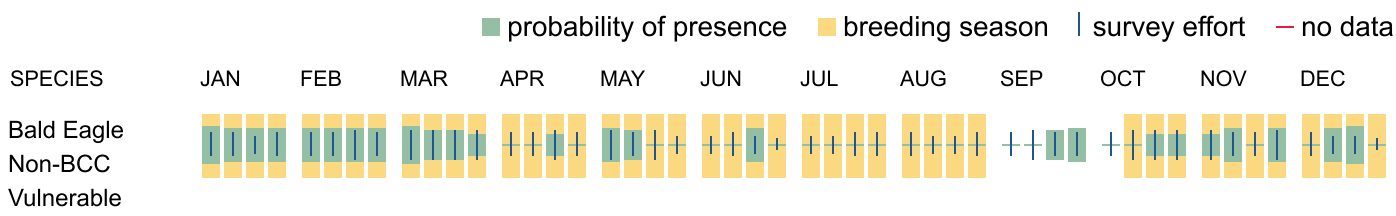
Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see

below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.



Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

NOT FOR CONSULTATION

Bald & Golden Eagles FAQs

What does IPaC use to generate the potential presence of bald and golden eagles in my specified location?

The potential for eagle presence is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are an eagle (Bald and Golden Eagle Protection Act requirements may apply).

Proper interpretation and use of your eagle report
On the graphs provided, please look carefully at the survey effort (indicated by the black vertical line) and for the existence of the "no data" indicator (a red horizontal line). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort line or no data line (red horizontal) means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list and associated information help you know what to look for to confirm presence and helps guide you in knowing when to implement avoidance and minimization measures to eliminate or reduce potential impacts from your project activities or get the appropriate permits should presence be confirmed.

How do I know if eagles are breeding, wintering, or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating, or resident), you may query your location using the RAIL Tool and view the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If an eagle on your IPaC migratory bird species list has a breeding season associated with it (indicated by yellow vertical bars on the phenology graph in your “IPaC PROBABILITY OF PRESENCE SUMMARY” at the top of your results list), there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

Interpreting the Probability of Presence Graphs

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. A taller bar indicates a higher probability of species presence. The survey effort can be used to establish a level of confidence in the presence score.

How is the probability of presence score calculated? The calculation is done in three steps:
The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.

To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

NOT FOR CONSULTATION

Breeding Season ()
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort ()
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

No Data ()
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Migratory birds

The Migratory Bird Treaty Act (MBTA) [1] prohibits the take (including killing, capturing, selling, trading, and transport) of protected migratory bird species without prior authorization by the Department of Interior U.S. Fish and Wildlife Service (Service). The incidental take of migratory birds is the injury or death of birds that results from, but is not the purpose, of an activity. The Service interprets the MBTA to prohibit incidental take.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide avoidance and minimization measures for birds
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

Measures for Proactively Minimizing Migratory Bird Impacts

Your IPaC Migratory Bird list showcases birds of concern, including Birds of Conservation Concern (BCC), in your project location. This is not a comprehensive list of all birds found in your project area. However, you can help proactively minimize significant impacts to all birds at your project location by implementing the measures in the Nationwide avoidance and minimization measures for birds document, and any other project-specific avoidance and minimization measures suggested at the link Measures for avoiding and minimizing impacts to birds for the birds of concern on your list below.

NOT FOR CONSULTATION

Ensure Your Migratory Bird List is Accurate and Complete

If your project area is in a poorly surveyed area, your list may not be complete and you may need to rely on other resources to determine what species may be present (e.g. your local FWS field office, state surveys, your own surveys). Please review the Supplemental Information on Migratory Birds and Eagles document, to help you properly interpret the report for your specified location, including determining if there is sufficient data to ensure your list is accurate.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, see the "Probability of Presence Summary" below to see when these birds are most likely to be present and breeding in your project area.

Review the FAQs

The FAQs below provide important additional information and resources.

NOT FOR CONSULTATION

NAME	BREEDING SEASON
American Golden-plover Pluvialis dominica This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds elsewhere
Bald Eagle Haliaeetus leucocephalus This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.	Breeds Oct 15 to Aug 31
Black-billed Cuckoo Coccyzus erythropthalmus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9399	Breeds May 15 to Oct 10
Bobolink Dolichonyx oryzivorus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds May 20 to Jul 31
Cerulean Warbler Setophaga cerulea This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/2974	Breeds Apr 21 to Jul 20
Chimney Swift Chaetura pelagica This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Mar 15 to Aug 25

Grasshopper Sparrow Ammodramus savannarum perpallidus — Breeds Jun 1 to Aug 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/8329

Henslow's Sparrow Centronyx henslowii — Breeds May 1 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3941

Kentucky Warbler Geothlypis formosa — Breeds Apr 20 to Aug 20
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Lesser Yellowlegs Tringa flavipes — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9679

Pectoral Sandpiper Calidris melanotos — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Prairie Loggerhead Shrike Lanius ludovicianus excubitorides — Breeds Feb 1 to Jul 31
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/8833

Prothonotary Warbler Protonotaria citrea — Breeds Apr 1 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Red-headed Woodpecker Melanerpes erythrocephalus — Breeds May 10 to Sep 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Ruddy Turnstone Arenaria interpres morinella — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA

NOT FOR CONSULTATION

Rusty Blackbird Euphagus carolinus This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA	Breeds elsewhere
Semipalmated Sandpiper Calidris pusilla This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA	Breeds elsewhere
Short-billed Dowitcher Limnodromus griseus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9480	Breeds elsewhere
Wood Thrush Hylocichla mustelina This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds May 10 to Aug 31

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (▬)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the

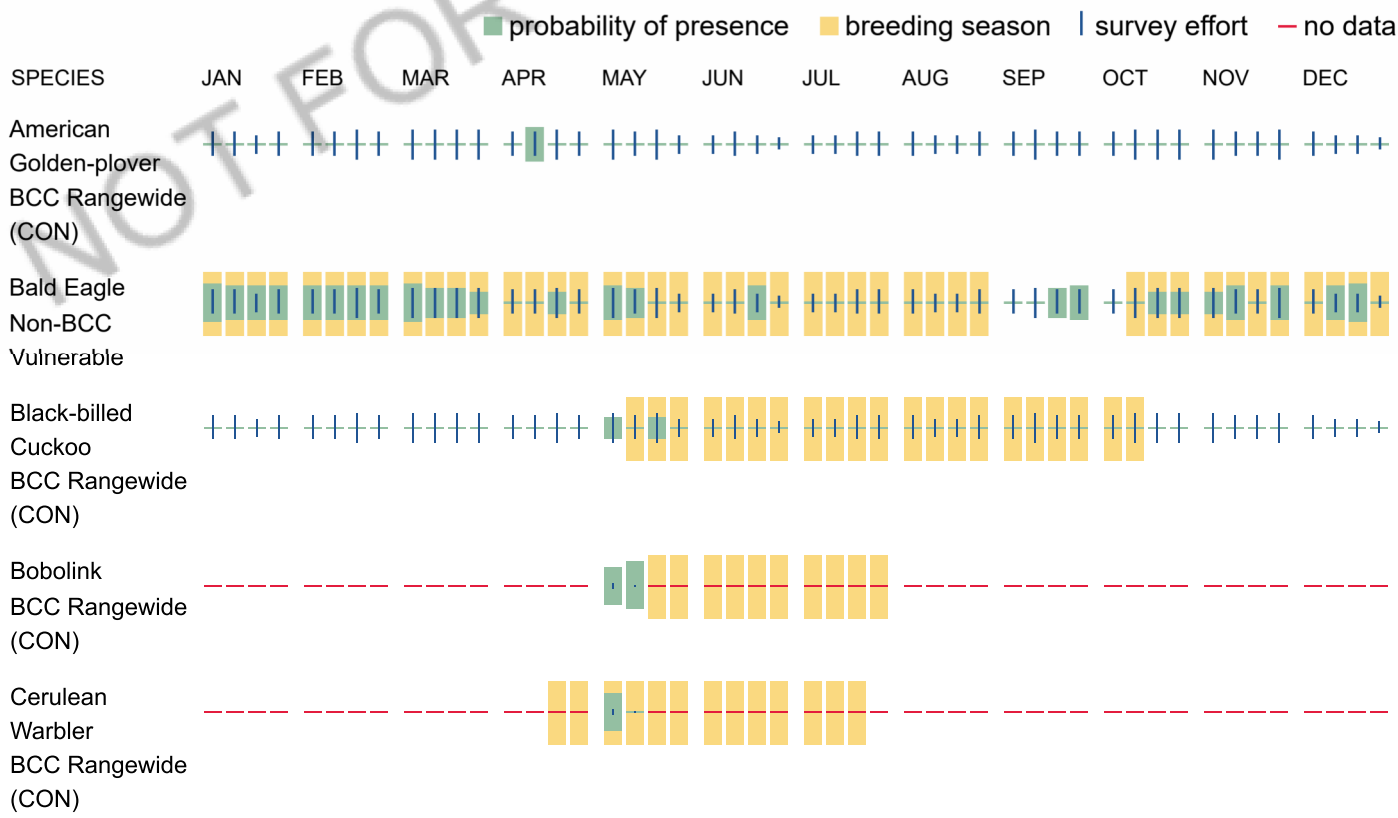
NOT FOR CONSULTATION

maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

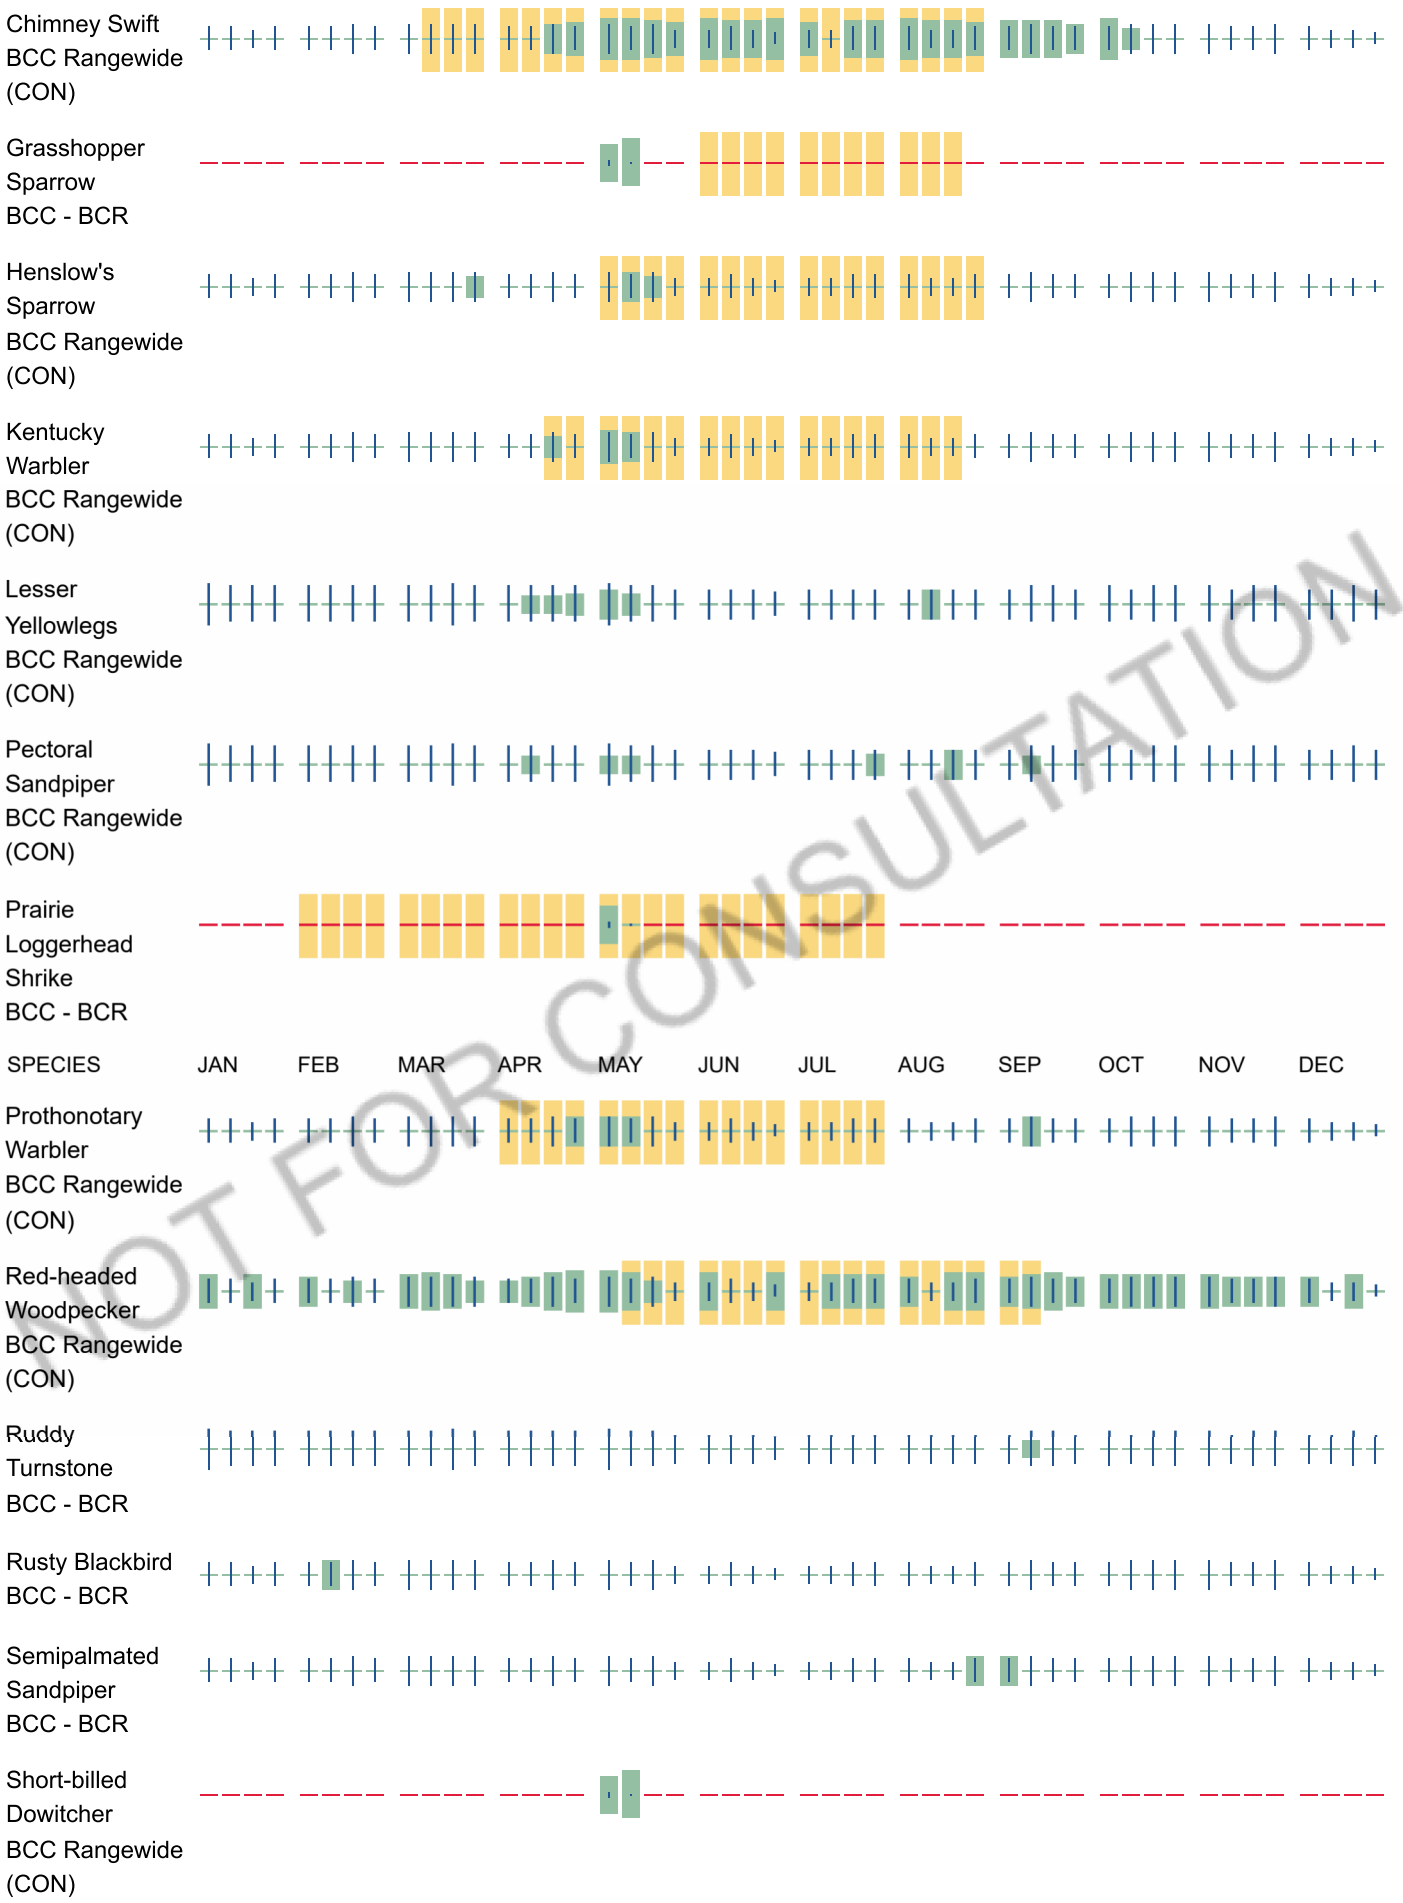
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.



Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.



To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Migratory Bird FAQs

Tell me more about avoidance and minimization measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Avoidance & Minimization Measures for Birds describes measures that can help avoid and minimize impacts to all birds at any location year-round. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is one of the most effective ways to minimize impacts. To see when birds are most likely to occur and breed in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the list of migratory birds that potentially occur in my specified location?

The Migratory Bird Resource List is comprised of Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location, such as those listed under the Endangered Species Act or the Bald and Golden Eagle Protection Act and those species marked as “Vulnerable”. See the FAQ “What are the levels of concern for migratory birds?” for more information on the levels of concern covered in the IPaC migratory bird species list.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) with which your project intersects. These species have been identified as warranting special attention because they are BCC species in that area, an eagle (Bald and Golden Eagle Protection Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, and to verify survey effort when no results present, please visit the Rapid Avian Information Locator (RAIL) Tool.

Why are subspecies showing up on my list?

Subspecies profiles are included on the list of species present in your project area because observations in the AKN for **the species** are being detected. If the species are present, that means that the subspecies may also be present. If a subspecies shows up on your list, you may need to rely on other resources to determine if that subspecies may be present (e.g. your local FWS field office, state surveys, your own surveys).

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets.

NOT FOR CONSULTATION

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go to the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating, or resident), you may query your location using the RAIL Tool and view the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If a bird on your IPaC migratory bird species list has a breeding season associated with it (indicated by yellow vertical bars on the phenology graph in your “IPaC PROBABILITY OF PRESENCE SUMMARY” at the top of your results list), there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Bald and Golden Eagle Protection Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially BCC species. For more information on avoidance and minimization measures you can implement to help avoid and minimize migratory bird impacts, please see the FAQ “Tell me more about avoidance and minimization measures I can implement to avoid or minimize impacts to migratory birds”.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Proper interpretation and use of your migratory bird report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please look carefully at the survey effort (indicated by the black vertical line) and for the existence of the "no data" indicator (a red horizontal line). A high survey effort is the key component. If the survey effort is high, then

NOT FOR CONSULTATION

the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list does not represent all birds present in your project area. It is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list and associated information help you know what to look for to confirm presence and helps guide implementation of avoidance and minimization measures to eliminate or reduce potential impacts from your project activities, should presence be confirmed. To learn more about avoidance and minimization measures, visit the FAQ "Tell me about avoidance and minimization measures I can implement to avoid or minimize impacts to migratory birds".

Interpreting the Probability of Presence Graphs
Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. A taller bar indicates a higher probability of species presence. The survey effort can be used to establish a level of confidence in the presence score.

How is the probability of presence score calculated? The calculation is done in three steps:
The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.

To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

Breeding Season ()
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort ()
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

No Data ()
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

There are no refuge lands at this location.

Fish hatcheries

There are no fish hatcheries at this location.

Wetlands in the National Wetlands Inventory (NWI)

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

This location overlaps the following wetlands:

FRESHWATER EMERGENT WETLAND

- PEM1K
- PEM1Cx

FRESHWATER FORESTED/SHRUB WETLAND

- PFO1A

FRESHWATER POND

- PUBK

NOT FOR CONSULTATION

R5UBH

A full description for each wetland code can be found at the National Wetlands Inventory website

NOTE: This initial screening does **not** replace an on-site delineation to determine whether wetlands occur. Additional information on the NWI data is provided below.

NOT FOR CONSULTATION

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in

activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate Federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

NOT FOR CONSULTATION

Table 4.1. Retardance Classification of Vegetal Covers

Retardance Class	Cover[1]	Condition
A	Weeping Love Grass	Excellent stand, tall, average 760 mm (30 in)
	Yellow Bluestem Ischaemum	Excellent stand, tall, average 910 mm (36 in)
B	Kudzu	Very dense growth, uncut
	Bermuda Grass	Good stand, tall, average 300 mm (12 in)
	Native Grass Mixture (little bluestem, bluestem, blue gamma, and other long and short midwest grasses)	Good stand, unmowed
	Weeping lovegrass	Good stand, tall, average 610 mm (24 in)
	Lespedeza sericea	Good stand, not woody, tall, average 480 mm (19 in)
	Alfalfa	Good stand, uncut, average 280 mm (11 in)
	Weeping lovegrass	Good stand, unmowed, average 330 mm (13 in)
	Kudzu	Dense growth, uncut
	Blue Gamma	Good stand, uncut, average 280 mm (11 in)
C	Crabgrass	Fair stand, uncut 250 to 1200 mm (10 to 48 in)
	Bermuda grass	Good stand, mowed, average 150 mm (6 in)
	Common Lespedeza	Good stand, uncut, average 280 mm (11 in)
	Grass-Legume mixture--summer (orchard grass, redtop, Italian ryegrass, and common lespedeza)	Good stand, uncut, 150 to 200 mm (6 to 8 in)
	Centipede grass	Very dense cover, average 150 mm (6 in)
	Kentucky Bluegrass	Good stand, headed, 150 to 300 mm (6 to 12 in)
D	Bermuda Grass	Good stand, cut to 60 mm (2.5 in) height
	Common Lespedeza	Excellent stand, uncut, average 110 mm (4.5 in)
	Buffalo Grass	Good stand, uncut, 80 to 150 mm (3 to 6 in)
	Grass-Legume mixture—fall, spring (orchard grass, redtop, Italian ryegrass, and common lespedeza)	Good stand, uncut, 100 to 130 mm (4 to 5 in)
	Lespedeza sericea	After cutting to 50 mm (2 in) height. Very good stand before cutting.
E	Bermuda Grass	Good stand, cut to height, 40 mm (1.5 in)
	Bermuda Grass	Burned stubble

[1] Covers classified have been tested in experimental channels. Covers were green and generally uniform.

4.1 GRASS LINING PROPERTIES

The density, stiffness, and height of grass stems are the main biomechanical properties of grass that relate to flow resistance and erosion control. The stiffness property (product of elasticity and moment of inertia) of grass is similar for a wide range of species (Kouwen, 1988) and is a basic property of grass linings.

Density is the number of grass stems in a given area, i.e., stems per m^2 (ft^2). A good grass lining will have about 2,000 to 4,000 stems/m^2 (200 to 400 stems/ft^2). A poor cover will have about one-third of that density and an excellent cover about five-thirds (USDA, 1987, Table 3.1). While grass density can be determined by physically counting stems, an easier direct method of estimating the density-stiffness property is provided in Appendix E of this manual.

Table 2. Permissible Shear and Velocity for Selected Lining Materials[1]

Boundary Category	Boundary Type	Permissible Shear Stress (lb/sq ft)	Permissible Velocity (ft/sec)	Citation(s)
Soils	Fine colloidal sand	0.02 - 0.03	1.5	A
	Sandy loam (noncolloidal)	0.03 - 0.04	1.75	A
	Alluvial silt (noncolloidal)	0.045 - 0.05	2	A
	Silty loam (noncolloidal)	0.045 - 0.05	1.75 – 2.25	A
	Firm loam	0.075	2.5	A
	Fine gravels	0.075	2.5	A
	Stiff clay	0.26	3 – 4.5	A, F
	Alluvial silt (colloidal)	0.26	3.75	A
	Graded loam to cobbles	0.38	3.75	A

3.2 Hydraulic Analyses

Analyses of the hydraulic characteristics of flooding from the sources studied were carried out to provide estimates of the elevations of floods of the selected recurrence intervals. Users should be aware that flood elevations shown on the FIRM represent rounded whole-foot elevations and may not exactly reflect the elevations shown on the Flood Profiles or the Floodway Data Tables in the FIS. Flood elevations shown on the FIRM are primarily intended for flood insurance rating purposes. For construction and/or floodplain management purposes, users are cautioned to use the flood elevation data presented in this FIS in conjunction with the data shown on the FIRM.

Cross sections used in the hydraulic analyses were interpolated from field surveys and from USGS topographic maps. The remaining cross sections, including all

Regional Planning Commission in 1961 and 1965 (Reference 11, 12).

The authority and acknowledgments for the city of Auburn, and villages of Loami, Mechanicsburg, Spaulding, and Williamsville are not included because there were no previously printed FIS for those communities.

May 3, 2004
Countywide FIS

For the 2004 Sangamon County FIS, the updated hydrologic and hydraulic analyses for the detailed study reaches of Spring Creek, Black Branch, Jacksonville Branch, Polecat Creek, and Fox Creek were prepared by the U.S. Army Corps of Engineers (USACE), Rock Island District, for FEMA. This work was completed in July 2000. Also, hydrologic and hydraulic analyses were prepared by Greene & Bradford, Inc., for Unnamed Tributary to Lick Creek for the village of Loami. This work was completed in August 1995.

August 2, 2007
Countywide FIS

No new hydrologic or hydraulic studies were conducted. However, existing data for Lake Springfield has been incorporated. The 1-percent-annual-chance flood elevation was reported in the USACE, Chicago District report, "Inspection Report for the National Dam Safety Program for Spaulding Dam, Lake Springfield, Sangamon County, Illinois" (Reference 19).

This revision to the previously effective countywide FIS, dated May 3, 2004 (Reference 20, 21), was performed under the Cooperating Technical Partners (CTP) Partnership Agreement (No. EMC-2004-GR-0214 and No. EMC-2005-GR-7026) between the Illinois Department of Natural Resources (hereafter referred to as IDNR) and the Federal Emergency Management Agency (FEMA), per the Mapping Activity Statement (MAS) No. IDNR04-2 and IDNR05-19.

Planimetric base map information was derived from USGS digital orthophoto quarter quadrangles at a one-half-meter ground resolution (Reference 22). USGS 7.5 Minute Series Topographic Maps at a scale of 1:24,000 were also used in the digitization process (Reference 23).

The coordinate system used for the production of the digital FIRMs is Universal Transverse Mercator (UTM), North American Datum of 1983 (NAD 83), Geodetic Reference System 1980 (GRS 80) spheroid.

MAY 12, 2026 1:06 PM HASEN01154
I:\25JOBS\25E0006_00\CAD\SITE\SHEET\G001-DEWATERING.DWG

GENERAL NOTES:

1. "IDOT STANDARD SPECIFICATIONS", WHERE REFERENCED IN THE PLANS OR TECHNICAL SPECIFICATIONS, REFERS TO THE "STANDARD SPECIFICATIONS FOR ROAD AND BRIDGE CONSTRUCTION" ADOPTED JANUARY 1, 2022, AND THE SUPPLEMENTAL SPECIFICATIONS AND RECURRING SPECIAL PROVISIONS, ADOPTED JANUARY 1, 2026 PUBLISHED BY THE ILLINOIS DEPARTMENT OF TRANSPORTATION (IDOT).

2. COORDINATES ARE SHOWN IN THE ILLINOIS STATE PLANE WEST ZONE COORDINATE SYSTEM. ELEVATIONS ARE BASED ON NAVD88.

3. FINISH GRADES SHALL BE SMOOTHLY TRANSITIONED TO ENSURE POSITIVE DRAINAGE AWAY FROM ALL STRUCTURES.

4. ALL OPEN EXCAVATION WORK SHALL BE PERFORMED IN ACCORDANCE WITH OSHA 29 CFR 1926, SUBPART P- "EXCAVATIONS". THE SUBCONTRACTOR SHALL DESIGNATE A QUALIFIED "COMPETENT PERSON" AS DEFINED IN OSHA SECTION 1926.650(b) PRIOR TO THE COMMENCEMENT OF ANY EXCAVATION ACTIVITIES.

5. ALL DEWATERING OF THE INFRASTRUCTURE EXCAVATIONS SHALL BE CONTAINED WITHIN THE DALLMAN ASH POND. WATER SHALL BE PUMPED TO DITCHES FOR THE WATER TO FLOW INTO THE CLARIFICATION POND. AT NO TIME WILL WATER BE ALLOWED TO BE PUMPED OVER THE BERMS AND OUTSIDE OF THE DALLMAN ASH POND.

6. EXCAVATED CCR MATERIAL WILL BE UTILIZED FOR ALL TRENCH AND STRUCTURE BACKFILL. COMPACTION WITH AN EXCAVATOR BUCKET OR SOME OTHER NON-CONVENTIONAL COMPACTIVE EFFORT WILL BE ALLOWED.

GENERAL NOTES

1. "IDOT STANDARD SPECIFICATIONS", WHERE REFERENCED IN THE PLANS OR TECHNICAL SPECIFICATIONS, REFERS TO THE "STANDARD SPECIFICATIONS FOR ROAD AND BRIDGE CONSTRUCTION" ADOPTED JANUARY 1, 2022, PUBLISHED BY THE ILLINOIS DEPARTMENT OF TRANSPORTATION (IDOT).
2. ALL SECTIONS, DETAILS, AND NOTES SHOWN ON THE DRAWINGS ARE INTENDED TO BE TYPICAL AND SHALL APPLY TO SIMILAR SITUATIONS ELSEWHERE, UNLESS OTHERWISE SHOWN.
3. CONTRACTOR SHALL VERIFY ALL DIMENSIONS AND EXISTING CONDITIONS BEFORE STARTING WORK. IF CONDITIONS VARY FROM THOSE INDICATED ON THE DRAWINGS, OWNER SHALL BE NOTIFIED AND NO WORK SHALL BE DONE IN THE AREA WITHOUT APPROVAL.
4. SCALE FOR THE DRAWINGS IS FOR GENERAL INFORMATION ONLY. LOCATIONS AND DIMENSIONS SHALL BE TAKEN AS SHOWN AND NOT SCALED.
5. IT IS CONTRACTOR'S RESPONSIBILITY TO ASCERTAIN EXISTING FIELD CONDITIONS BEFORE BIDDING ON THIS PROJECT, ORDERING MATERIALS, OR BEGINNING CONSTRUCTION.
6. CONTRACTOR'S WORK ACTIVITIES SHALL BE RESTRICTED TO AREAS WITHIN THE LIMITS OF CONSTRUCTION. CONTRACTOR'S ACTIVITIES AND VEHICLES SHALL NOT BE ALLOWED OUTSIDE OF THESE LIMITS UNLESS APPROVED BY OWNER.
7. DISTURBED EARTH SURFACES SHALL BE SEEDED PER THE PROJECT SPECIFICATIONS.
8. CONTRACTOR IS RESPONSIBLE FOR THE SITE RESTORATION.
9. TEMPORARY EROSION CONTROL SYSTEMS SHALL BE INSTALLED IN ACCORDANCE WITH IDOT STANDARD DRAWING 280001-07 TEMPORARY EROSION CONTROL SYSTEMS. AND ARTICLE 280 OF THE IDOT STANDARD SPECIFICATIONS.
10. ALL OPEN EXCAVATION WORK SHALL BE PERFORMED IN ACCORDANCE WITH OSHA 29 CFR 1926, SUBPART P- "EXCAVATIONS". THE SUBCONTRACTOR SHALL DESIGNATE A QUALIFIED "COMPETENT PERSON" AS DEFINED IN OSHA SECTION 1926.650(b) PRIOR TO THE COMMENCEMENT OF ANY EXCAVATION ACTIVITIES.

SURVEY AND LAYOUT

1. THE DESIGN PLANS INCLUDED WERE BASED UPON A HORIZONTAL COORDINATE SYSTEM BASED ON THE NORTH AMERICAN DATUM OF 1983 (NAD83), ILLINOIS STATE PLANE WEST ZONE AND VERTICAL ELEVATIONS BASED ON NORTH AMERICAN VERTICAL DATUM OF 1988 (NAVD88).
2. CONTRACTOR SHALL BE RESPONSIBLE FOR RE-ESTABLISHING ANY PROPERTY MONUMENTS THAT BECOME DAMAGED OR DESTROYED DURING CONSTRUCTION ACTIVITIES.
3. CONTRACTOR SHALL BE RESPONSIBLE FOR PROPER ALIGNMENT (VERTICAL AND HORIZONTAL) AT ALL INTERFACES BETWEEN NEW AND EXISTING WORK TO ASSURE PROPER INSTALLATION AND USAGE.
4. MONITORING WELLS IDENTIFIED ON THE PLAN SHEETS SHALL BE PROTECTED FROM DAMAGE DURING THE SITE WORK, EXCEPT THOSE IDENTIFIED FOR REMOVAL.

B

A

CONSTRUCTION SEQUENCE:

STEP 1
INSTALL TEMPORARY EROSION AND SEDIMENT CONTROL MEASURES.

STEP 2
GRADE THE EXISTING SURFACE OF DALLMAN ASH POND TO DRAIN TOWARD THE OUTSIDE EDGES PRIOR TO PLACING FILTER BAGS.

STEP 3
PUMP WATER FROM THE 10 NEW DEWATERING WELLS TO LOWER WATER CONTENT OF THE DALLMAN ASH POND.

STEP 4A
MOVE ENOUGH DRY LAKESIDE ASH POND CCR TO STOCK PILES ON DALLMAN ASH POND SO SLURRY OPERATIONS CAN BEGIN.

STEP 4B
SLURRY LAKESIDE ASH POND AND PUMP INTO FILTER BAGS INSTALLED ON THE SURFACE OF THE DALLMAN ASH POND.

STEP 4C
RAISE THE DEWATERING WELLS AS BAGS ARE BUILT UP AROUND THE WELLS.

STEP 5
USE DRY CCR MATERIAL OR LAKESIDE ASH POND BERM MATERIAL TO COVER THE FILTER BAGS AND GRADE TO THE ELEVATIONS SHOWN ON THE FINAL COMPLETION PLAN.

STEP 6A
COMMENCE ALTERNATE FINAL COVER INSTALLATION (CLOSURETURF) ONCE ALL MATERIAL IS TRANSFERRED FROM THE LAKESIDE ASH POND TO THE DALLMAN ASH POND. THE DEWATERING WELLS WILL BE RAISED TO THE FINAL SURFACE ELEVATION AND WILL REMAIN IN PLACE TO FACILITATE FUTURE DEWATERING OPERATIONS.

STEP 6B
CONSTRUCT LAKESIDE CHANNEL OUTFALL
GRADE THE LAKESIDE ASH POND TO DRAIN VISIBLY REMOVING ALL CCR.
APPLY FERTILIZER, SEED AND MULCH.

STEP 7
ONCE FINAL SEEDING IS ESTABLISHED, REMOVE TEMPORARY EROSION AND SEDIMENT CONTROLS.

85	Municipal Point Source Discharges

Source ID	Description
87	Non-irrigated Crop Production
92	On-site Treatment Systems (Septic Systems and Similar Decentralized Systems)
95	Other Recreational Pollution Sources
102	Petroleum/natural Gas Activities
115	Sanitary Sewer Overflows (Collection System Failures)
122	Site Clearance (Land Development or Redevelopment)
124	Spills from Trucks or Trains
125	Streambank Modifications/destabilization
126	Subsurface (Hardrock) Mining
127	Surface Mining
130	Unpermitted Discharge (Domestic Wastes)
132	Upstream Impoundments (e.g., Pl-566 NRCS Structures)
135	Wet Weather Discharges (Point Source and Combination of Stormwater, SSO or CSO)
140	Source Unknown
142	Dam or Impoundment
143	Livestock (Grazing or Feeding Operations)
144	Crop Production (Crop Land or Dry Land)
155	Natural Sources
156	Agriculture
157	Habitat Modification - other than Hydromodification
161	Pesticide Application
177	Urban Runoff/Storm Sewers
178	Coal Mining (Subsurface)
181	Runoff from Forest/Grassland/Parkland

Appendix B-2. Specific Assessment Information for Streams, 2012.
