RE: CCR Surface Impoundments
Assessment of Corrective Measures Revised October 2026

Dear Ms. Dierich:

Provided herein is the revised Assessment of Corrective Measures for the CCR Surface Impoundments in accordance with paragraph 270 of the Consent Agreement and Final Order effective January 14, 2025 and comments received from EPA on August 11, 2026.

Should you have any questions or require additional information, please contact me at 217-757-8610 ext. 1110.

Sincerely,

PJ Becker
Environmental Health and Safety Manager

Certification of City Water, Light and Power

City of Springfield, Office of Public Utilities, d/b/a City Water, Light and Power provides the following certification as required by paragraph 300 of the Consent Agreement and Final Order effective January 14, 2025.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I have no personal knowledge that the information submitted is other than true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

1. Introduction

1.1 Regulatory Requirements

This document serves as CWLP's Assessment of Corrective Measures (ACM) as agreed in the January 2025 Consent Agreement and Final Order. This ACM addresses the surface impoundments statistically significant levels (SSL) identified in the February 13, 2025 Groundwater Protection Standards Report for arsenic at RW-3, AP-7, AP-8 and AW1 along with cobalt at AP-2A and AP-3.

§ 257.95(g)(3)

- This regulation sets forth the requirements if any of the constituents listed in Appendix IV have been detected at a statistically significant level exceeding the groundwater protection standards.

§ 257.96

- This regulation sets forth the requirements of an assessment of corrective measures.

Consent Agreement and Final Order Attachment 1

- Additional requirements were provided to be considered in the assessment of corrective measures.

2. Site Background

2.1 Lakeside and Dallman Ash Ponds [Attachment 1, Item 1]

The CWLP ash ponds are in Section 12 R.5W, T.15N of the Third Principal Meridian in Springfield, Sangamon County, Illinois. The Site is in the Springfield Plain of the Central Lowland Province Physiographic Division of Illinois (Leighton et al., 1948).

The older of the two (2) impoundments is Lakeside Ash Pond (LAP). LAP has a footprint of approximately 36 acres and contains approximately 1,565,000 cubic yards (cu. yds.) of CCR along with water treatment plant sludge. The floor of LAP is approximately elevation 530 ft. and slopes upward in the southeast corner following the natural topography. This places the impoundment floor anywhere from 16.77 ft. (minimum) to over 69 ft. (maximum) above the Basal Sand Unit. The mean separation is 34.34 ft., and the median separation is 29.67 ft. (see Figure 1).

Dallman Ash Pond (DAP) has a footprint of approximately 36 acres and contains approximately 1,217,000 cu. yds. of CCR. The floor of DAP slopes from the south to the northeast corner (from elevation 525 ft. to about 523 ft. Note that the bottom of DAP at boring D4 is over elevation 530 ft. The DAP floor is anywhere from 10.27 ft. (minimum) to 19.86 ft. (maximum) above the top of the Basal Sand Unit. There is a mean separation of 15.21 ft. and a median separation of 15.42 ft. (see Figure 1).

2.2 Site Geology

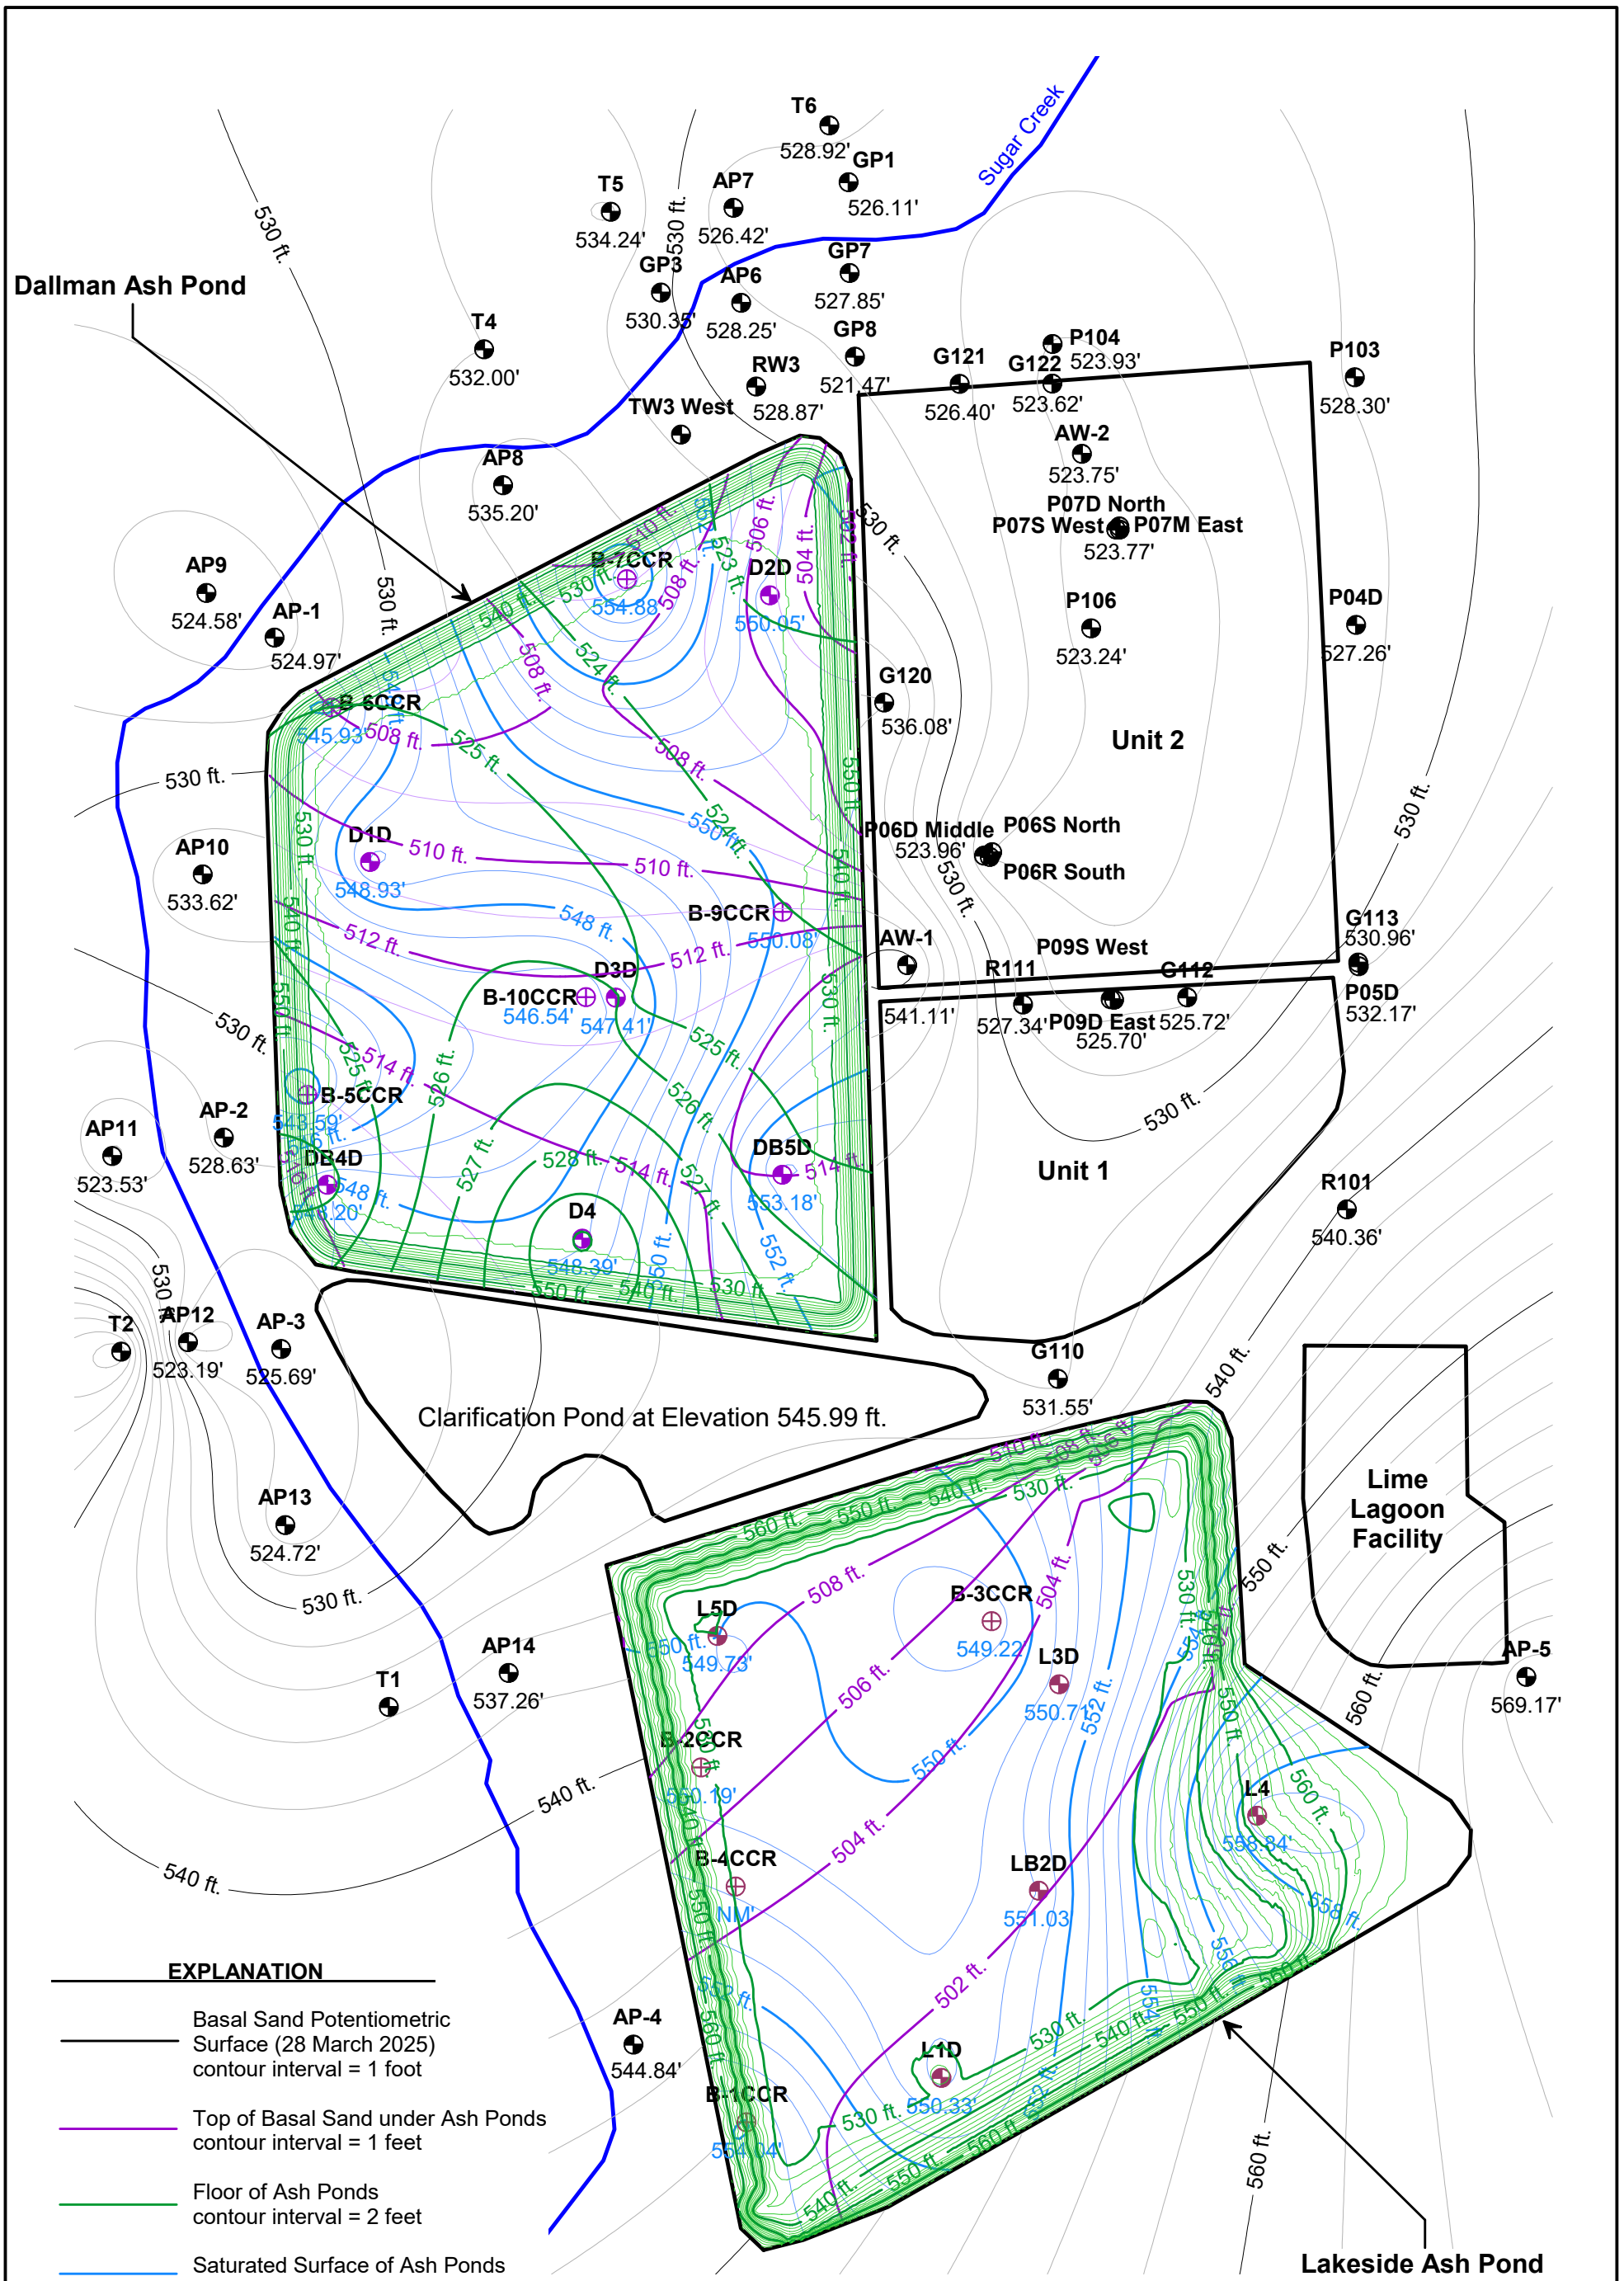
General Site geology consists of five (5) units. Maps showing the structural contours and isopaches for each unit are in Appendix A:

2.2.1 Upper Cohesive Unit

The Upper Cohesive Unit (UCU) consists of gray to brown silty clay, clayey silt, and clay with plastic, soft to stiff consistency. Its similarity to the Lower Cohesive Unit makes it difficult to differentiate between the Upper and Lower Cohesive Units where the Shallow Sand Unit is not present. Hanson believes that the Shallow Sand Unit has been removed within the footprints of the Dallman and Lakeside Ash Ponds.

2.2.2 Shallow Sand Unit

Sitting above the Lower Cohesive Unit, the Shallow Sand Unit (SSU) consists of gray, silty to clayey fine-grained sand. It is also associated with lenses of silty clay and clayey silt. The Shallow Sand Unit can be found in isolated locations (i.e., portions of the floor of Unit 2,along the north side of Dallman Ash Pond from the middle north side to the eastern edge, and a small sand lens west of Lakeside Ash Pond). Due to the elevation differences between the three (3) shallow sand areas, Hanson interprets that these are different sand units. The Unit 2 Shallow Sand ranges from 0.0 to 6.0 ft. in thickness, the north Dallman Shallow Sand also ranges from 0.0 to 6.0 ft. in thickness, and the Lakeside Shallow Sand ranges from 2.5 to 7.0 ft. in thickness. Slug tests were performed on several wells located in the Unit 2 footprint. The geometric mean of the measurements is 5.92×10^{-4} cm/sec with a median hydraulic conductivity of 9.8×10^{4} cm/sec.



2.2.3 Lower Cohesive Unit

The Lower Cohesive Unit (LCU) generally consists of brown to gray, silty clay, clayey silt, and clay with a plastic, soft to stiff consistency. Throughout most of the Site, the LCU is overlain by the Upper Cohesive Unit. Recent investigations were conducted in both impoundments to evaluate the CCR and the LCU below. Shelby tube samples were collected from the LCU immediately below the CCR in both ash ponds. The maximum hydraulic conductivity is 6.8×10^{-6} cm/sec, and the minimum hydraulic conductivity is 1.7×10^{-8} cm/sec. The geometric mean is 3.42×10^{-7} cm/sec, and the median hydraulic conductivity is 3.65×10^{-7} cm/sec.

2.2.4 Basal Sand Unit

The Basal Sand Unit (BSU) typically sits directly on the Pennsylvanian age shales or weathered shales. The sand consists of gray, poorly sorted, silty to clayey fine- to medium-grained sand and may also have poorly sorted sand with traces of gravel. Within the floodplain area (where the impoundments and landfills are located), the elevation of the top of the BSU ranges from a maximum of 554.9 ft. to a minimum of 495.8 ft. Note that in the upland area where the Lime Lagoons are located, the elevation of the top of the sand that sits directly on the shale bedrock is at approximately 560 ft. and slopes downward to the east. Thickness ranges from less than 1.0 ft. to a maximum of 18.45 ft. Geometric mean thickness is 6.65 ft., and the median thickness is 7.93 ft.

Recently, the BSU monitoring wells were slug tested by Hanson to determine hydraulic conductivity values for the unit. Hydraulic conductivity results from the slug tests showed a maximum value of 8.84×10^{-2} cm/sec and a minimum value of 4.57×10^{-5} cm/sec. The geometric mean of the Basal Sand Unit hydraulic conductivities is 1.78×10^{-3} cm/sec, and the median value is 1.64×10^{-3} cm/sec.

EXPLANATION

- Basal Sand Potentiometric Surface (28 March 2025) contour interval = 1 foot
- Top of Basal Sand under Ash Ponds contour interval = 1 feet
- Floor of Ash Ponds contour interval = 2 feet
- Saturated Surface of Ash Ponds contour interval = 0.5 feet

2.2.5 Bedrock Unit

The Bedrock Unit (BU) consists primarily of Pennsylvanian age gray shales with some coal seams. Bedrock elevations range from 560 ft. on the west side of the Lime Lagoon area east of Lakeside Ash Pond to the mid-490 ft. range in Unit 2. There is also a bedrock knob (elevation 525 ft. plus) located on either side of Sugar Creek near the northeast corner of Dallman Ash Pond. Previous investigations indicated that the shale hydraulic conductivities are in the low-10^{-7} cm/sec to low-10^{-6} cm/sec with deeper packer testing results are less than 1 x 10^{-9} cm/sec (AEI, 2024).

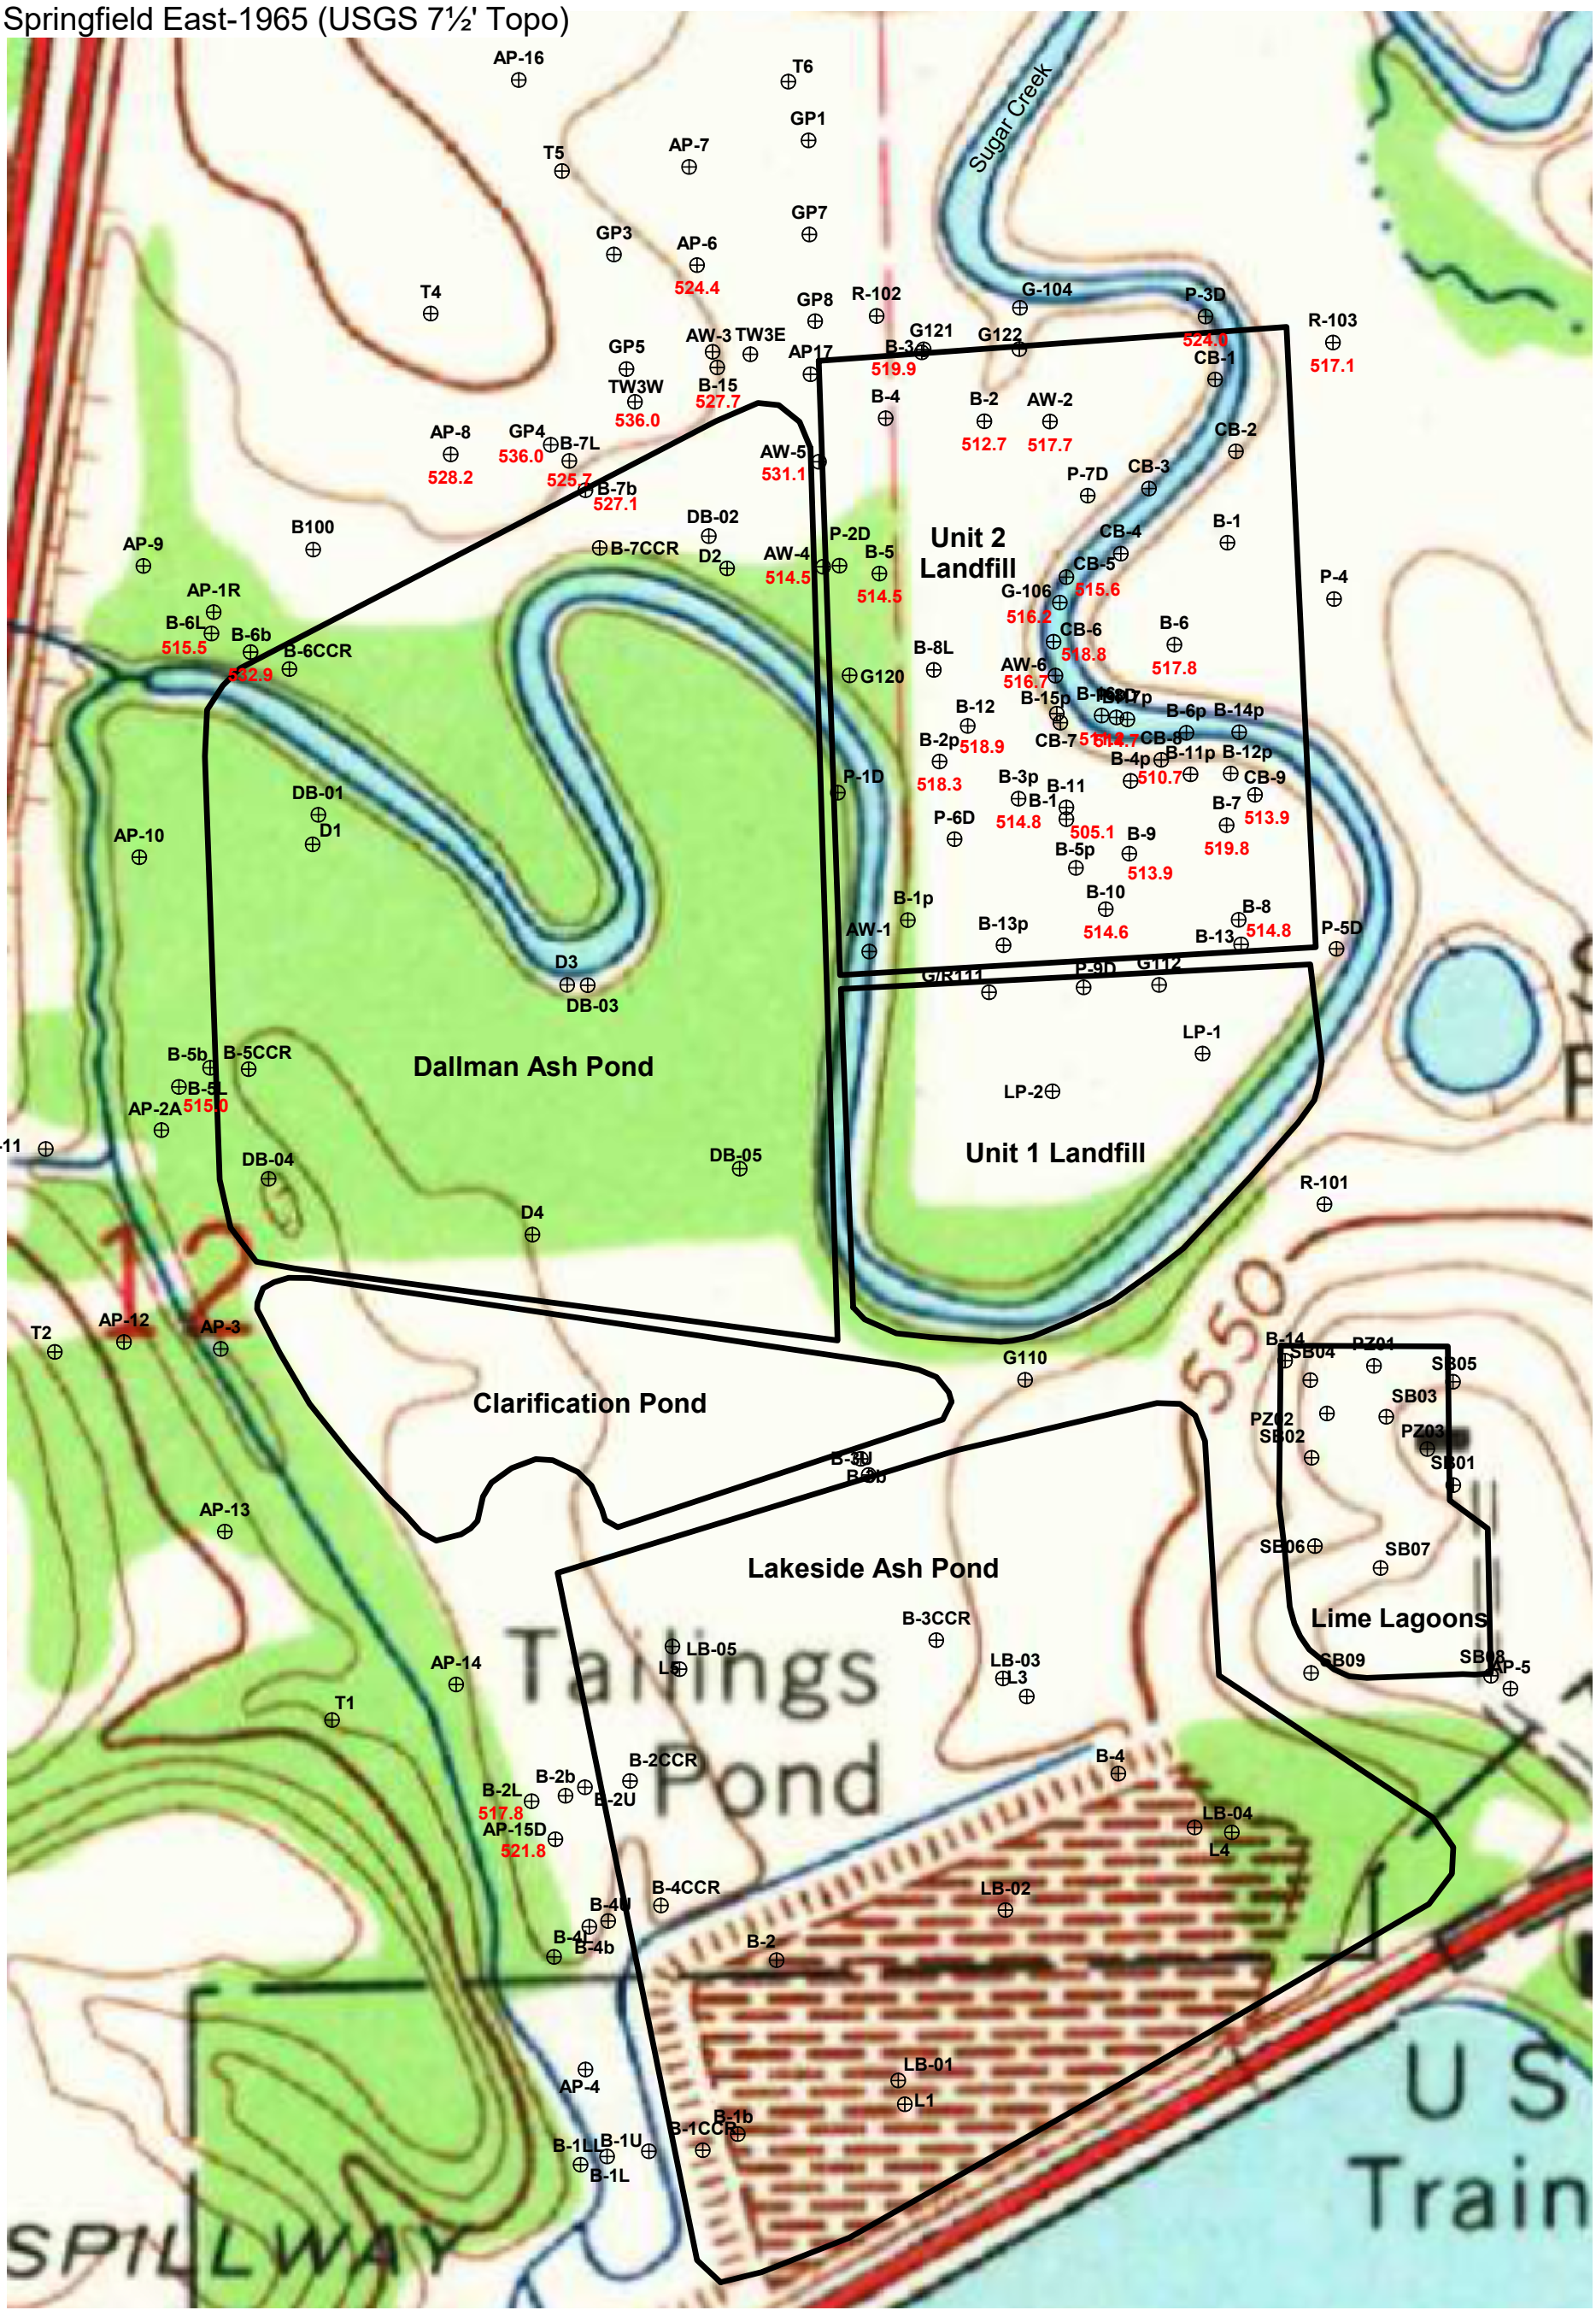
3. Initiate Assessment of Corrective Measures [40 C.F.R. §§ 257.95(g)(3)(i) and 40 C.F.R. §§ 257.96(a)]

On March 6, 2025, CWLP provided notice of initiation of assessment of corrective measures. This notice fulfills the obligation of 40 C.F.R. §§ 257.95(g)(3) and 40 C.F.R. §§ 257.96(a).

4. Groundwater Monitoring [40 C.F.R. §§ 257.96(b)]

CWLP continues to monitor groundwater as specified in 40 C.F.R. §§ 257.95.

5. Nature and Extent of Releases [Attachment 1, Item 2]



A Nature and Extent Report was completed in 2025 for the Appendix IV parameters that exceeded the Statistically Significant Levels (SSLs) for Arsenic and Cobalt. An Addendum to the Nature and Extent Report was completed in 2026. Arsenic exceedances were observed above the SSL at AW-1, RW-3, AP-7, and AP-8. Cobalt exceedances were observed above the SSL at AP2A and AP-3. CWLP is continuing to treat the SSLs as impacts from the DAP and is continuing assessment monitoring which is not anticipated to affect the proposed closure of the two (2) surface impoundments. The complete September 2025 Nature and Extent Report (AEI, 2025c) which includes a Flow Path Report as Appendix J (AEI, 2025c) is in Appendix B of this document. A recent Addendum to the Nature and Extent Report (AEI, 2026), addressing the potential contaminant migration pathways with an updated hydrogeological conceptual site model, is in Appendix C.

6. Evaluation of Abandoned Creek [Attachment 1, Item 3]

A portion of the abandoned Sugar Creek exists north of Unit 2 Landfill. The creek bed has an elevation of approximately 523 ft. Borings in Unit 2 have pre-construction Shallow Sand Unit elevations between 524 to 514 ft. The floor of Dallman Ash Pond generally ranges from approximately 525 to 522 ft., which is below the elevation of the sand seam adjacent to the north side of Dallman (536 to 524 ft.). See Figure 2 for borings and Shallow Sand elevations relative to the pre-relocated Sugar Creek. The Nature and Extent Report indicates in Section 3.2 that remnants of the original Sugar Creek channel or engineered fill materials in the channel could act as a potential migration pathway for contaminants.

Figure 2 also shows the preconstruction elevations within the DAP footprint (USGS, 1965). Note that the 530 ft. contour hugs the shoreline of Sugar Creek. With the post-construction elevation of the DAP floor being 5 to 7 ft. below the pre-construction topography, Hanson believes that the abandoned sections of Sugar Creek within the DAP footprint were removed during construction. This is supported by the borings in DAP (D1, D2, D3, D4, DB01, DB02, DB03, DB04, and DB05 along with AW-1 that shows fill materials above elevation 529.25 ft. and Lower Cohesive Unit clayey silts below.

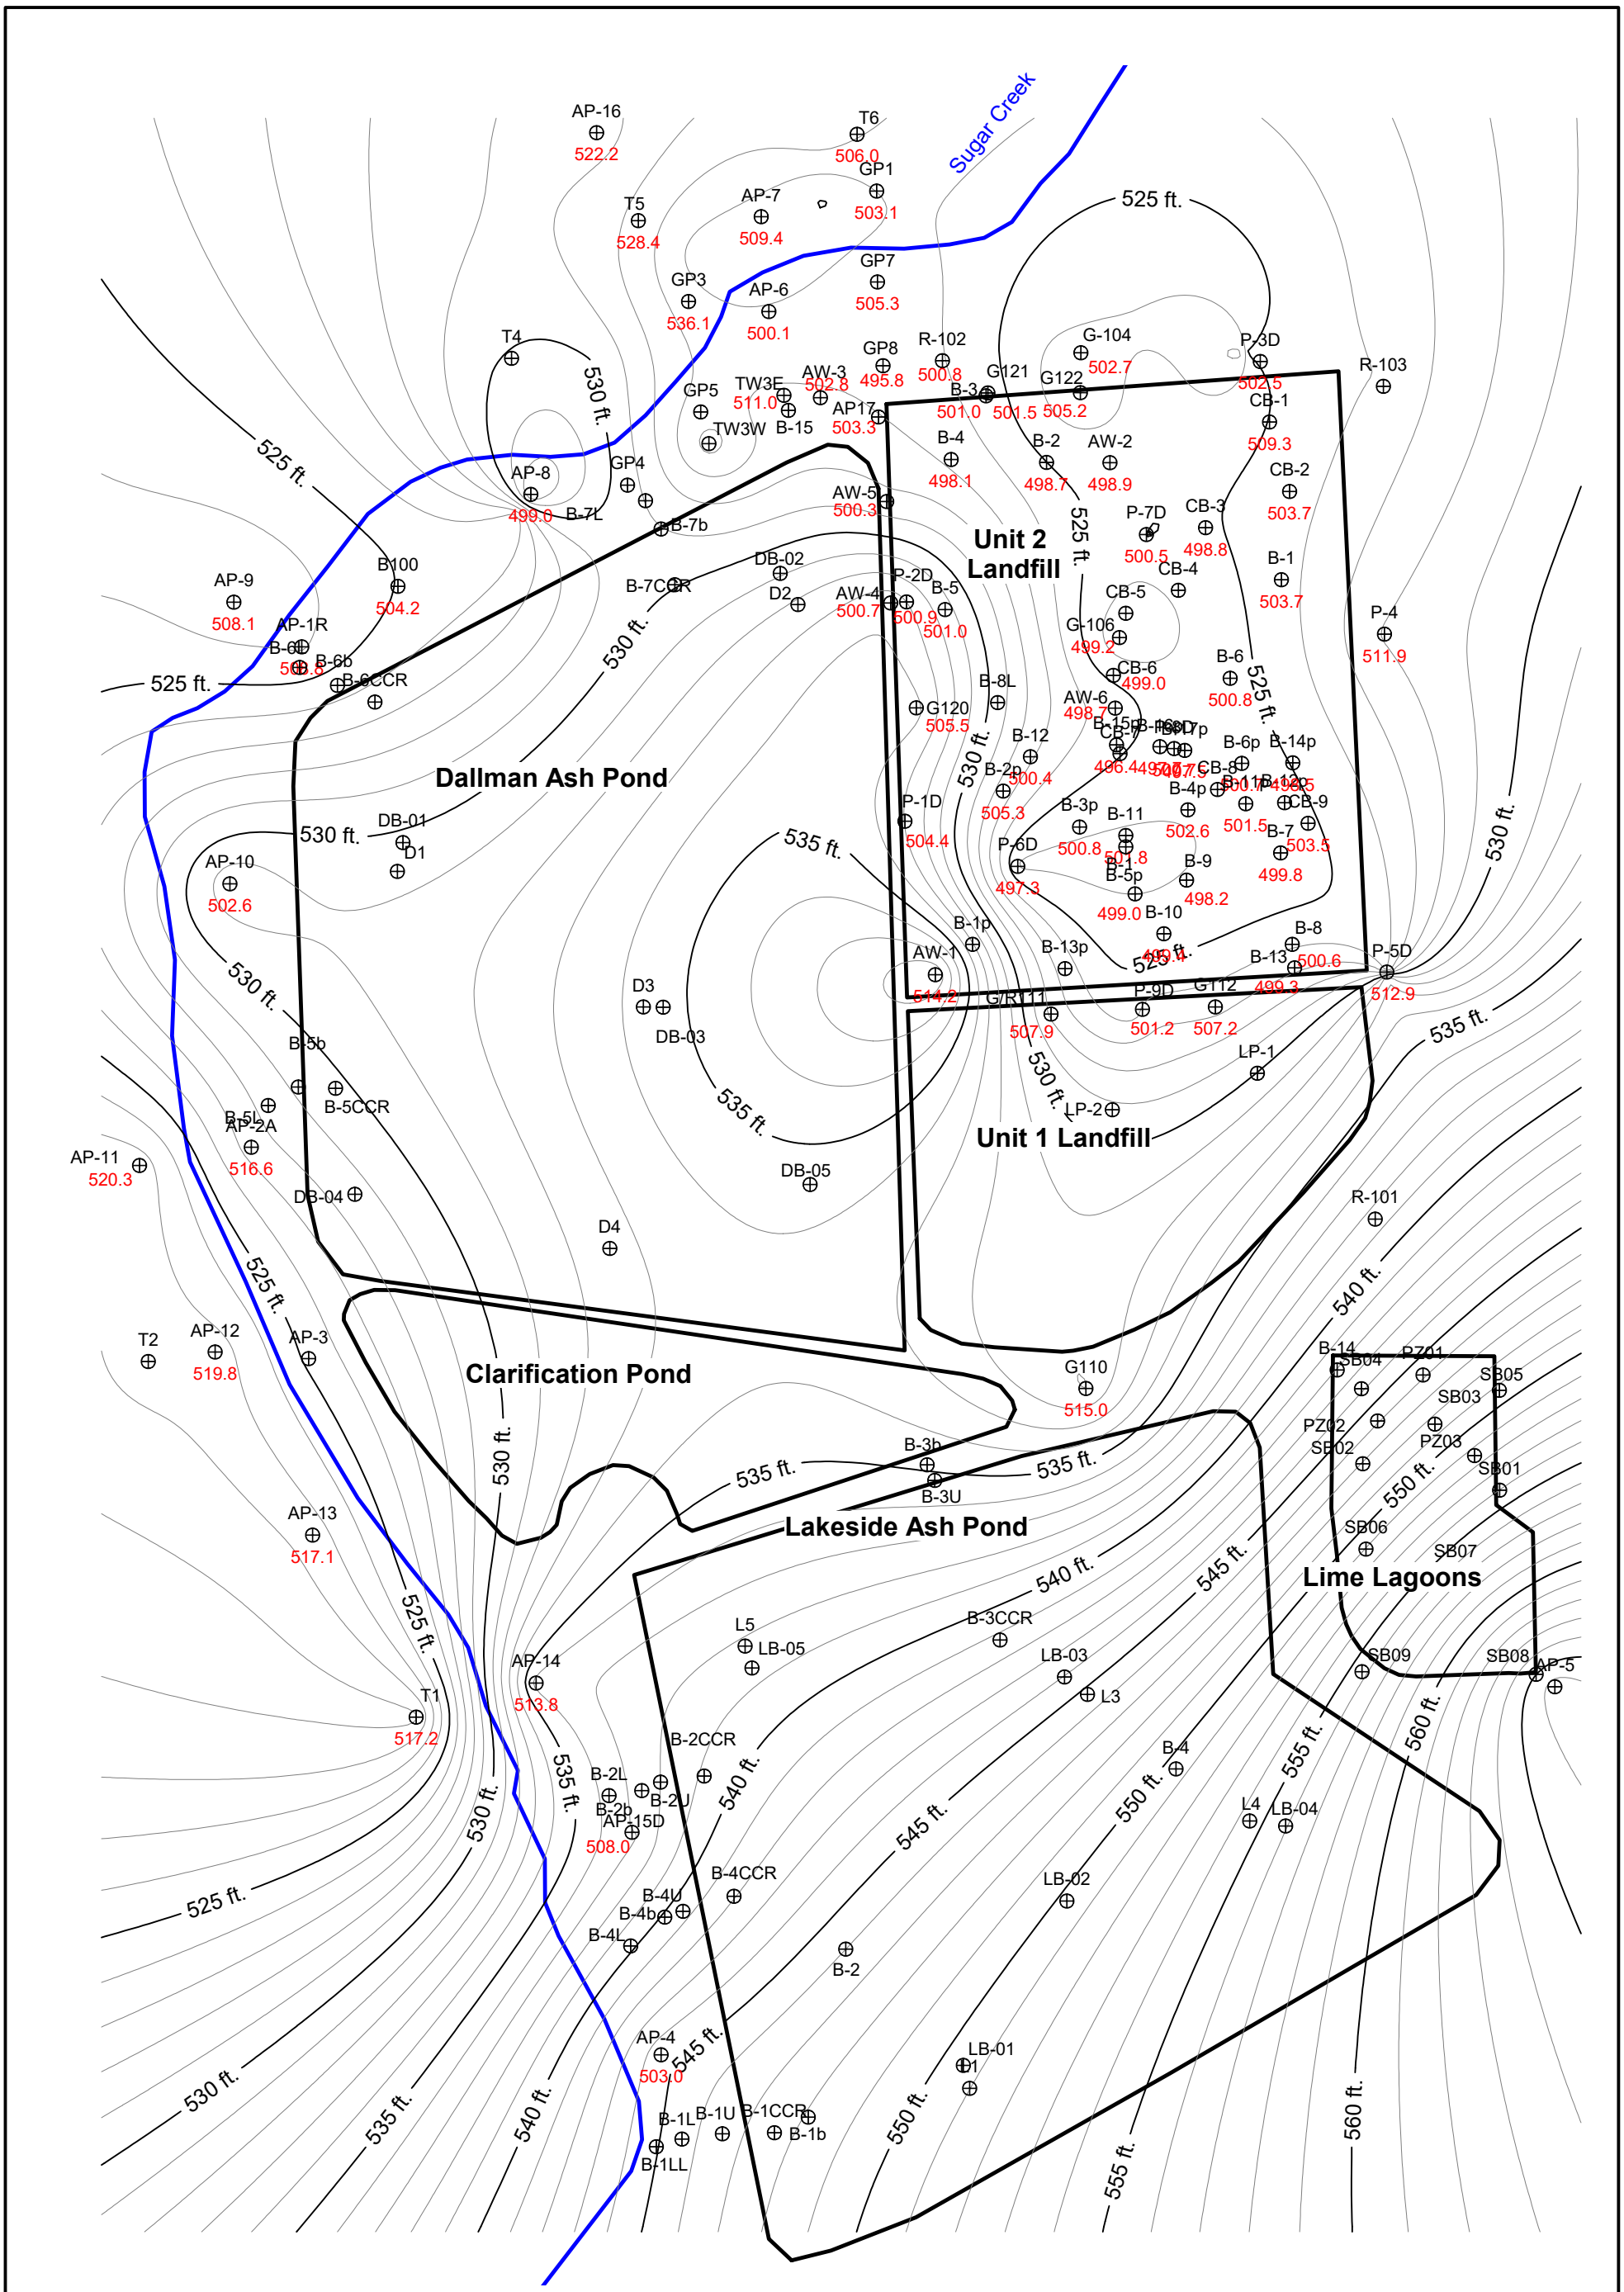
7. Groundwater Elevation Data [Attachment 1, Item 4]

Figure 1 shows the relationship between the potentiometric surface of the Basal Sand Unit (for 28 March 2025), the top elevation of the Basal Sand Unit, the floor of the impoundments, and the water surfaces inside each impoundment. From this figure it can be determined that:

1. There is separation between the top of the Basal Sand Unit (which is also the water level within the Basal Sand Unit) and the floor of each impoundment (greater than 5 feet).
2. The Basal Sand Unit is a confined aquifer (measured water level consists of the thickness of the aquifer plus a pressure component of head).
3. Groundwater flows from the upland area where the Lime Lagoons are located and discharges toward Sugar Creek to the west and northwest.
4. The water level in the Dallman Ash Pond is higher than in the Clarification Pond, which indicates that there is limited connection between the two (2) water bodies.
5. Removal of the free water in the Dallman Ash Pond should reduce the likelihood of seepage out of the impoundment and could potentially provide an inward gradient (groundwater moving into the impoundment).

8. Contaminant Transport Control [Attachment 1, Item 5]



CCR is not anticipated to be in contact with groundwater, now or after closure. The Basal Sand Unit is a confined aquifer, and the Lower Cohesive Unit separates the CCR from the Basal Sand Unit.

The potentiometric surface water levels should not be confused with those of a phreatic water surface or water table. The phreatic water surface shows the elevation where the groundwater is at one atmosphere pressure. Conversely, the pressure component of the potentiometric surface can be multiple time the one atmosphere pressure observed in a phreatic surface. That is why the water level observed in a well that penetrates a confined aquifer is always above the top of the aquifer or is in an artesian condition.

The Nature and Extent Report (see Section 3.3). concludes that migration of Appendix IV parameters, arsenic and cobalt, could migrate through the low hydraulic conductivity deposits of the Lower Confining Unit due to the vertical downward gradient created by the impounded water within LAP and DAP coupled with the over 5 decades of time since the CCR Units were put into service.

9. Remedy Feasibility [40 C.F.R. §§ 257.96(c), Attachment 1, Item 6]

Several remedies are presented below that outline the feasibility and practicality of the various closure options. These include discussions of performance, implementation, implementation time, and potential impacts and exposures for each remedy. Note that permitting requirements and timing to receive permits are not included in the time proposed for each closure remedy. Illinois Environmental Protection Agency (IEPA) must review and approve any Construction Permit application pursuant to 35 IAC 845.220. The dewatering wells will remain in place after placement of the final cover system.

Water levels measured on 24 September 2026.

Dewatering will need to be completed for almost all the remedies listed. This is needed to meet regulatory requirements and to identify settlement as the CCR dewaters. This will allow adjustments to maintain positive drainage on the final cover slopes. Hanson has estimated the times to dewater each ash pond, with DAP needing approximately 140 days and LAP needing approximately 360 days to dewater. These timeframes are based on the anti-degradation study done as part of the National Pollutant Discharge Elimination System (NPDES) permitting process.

Dewatering will be accomplished using ten (10) wells installed in DAP with locations identified on the plans in Appendix G. Dewatering wells, dewatering piezometers, discharge structures, and pump requirements are included in the plan set. Once dewatered, DAP will have decreased ability to have contaminants migrate to the Shallow Sand and Basal Sand Aquifers.

Dewaters will be sent to the Clarification Pond where they will be treated to lower the pH and then discharged at Outfall 004. An NPDES permit modification was approved by Illinois EPA on February 25, 2026 allowing the discharge of CCR contact waters. The dewatering wells will remain in place after placement of the final cover system and will be utilized after closure, if necessary.

Hanson is surprised by how much water remains within the LAP CCR, based on lab testing performed on samples from DAP and LAP. Table 1 lists the sample boring and depth followed by the tested parameters and results for the various CCR samples. The water treatment plant sludge samples are included for reference.

Table 1. Physical Properties of CWLP CCR

Source: Agvice Laboratories, Northwood, ND

The important properties listed in Table 1 are Porosity and Field Capacity. Porosity identifies how much water the CCR can hold (as a percentage). Field Capacity is defined as "the amount of water held in soil after the gravitational water has drained away." (Foth & Turk, 1972). There is a noticeable difference between the DAP CCR versus the LAP CCR. DAP porosities generally range from the low- to mid-50%,

whereas the LAP porosities generally range from the low-60% to low-70%. That ability to contain water is also seen in the Field Capacities (FC). DAP FCs range from the mid-30% to low-40% and LAP FCs range from the low-50% to the low-60%. The FC percentages are an indication of the volume of water that is retained within the CCR after it has been dewatered. Therefore, the volume of water removed is only the portion of the total water within the CCR that can be removed by gravity drainage.

9.1 Closure Alternatives

The closure alternative remedies discuss the final disposition of the CCR in the DAP and LAP. These alternatives look at whether the CCR remains or if it is removed. Either of these remedies can meet the requirements of 40 CFR 257.97(b).

Remedies comply with 40 CFR 257.97(b) and are protective of human health and the environment because the CCR is moved to another location or dewatered and covered in place. Attaining the groundwater protection standards may require the use of one or more of the ancillary alterative listed in Section 9.2. Controlling the source(s) of release is controlled by dewatering and final cover systems. Removal of contaminated materials, again, would be done with one or more of the ancillary alternatives listed in Section 9.2. All wastes, either moved or retained on site will be managed following applicable RCRA requirements.

The various remedies below address the need for dewatering the CCR, the time the closure activities will take, any implementation issues, and health/safety concerns.

9.1.1 Closure-In-Place

Closure-in-Place will require placing final cover on both the DAP and LAP. This can be done with a conventional final cover system consisting of 40 mil HDPE or LLDPE covered with 3 feet of soil [per 35 IAC 845.750(c)[†]] or an acceptable substitute, such as ClosureTurf®. ClosureTurf® is a patented, three component system comprised of a structured geomembrane, an engineered turf, and a specified aggregate infill. The Hutsonville Power Station Ash Ponds were closed using a conventional final cover system as defined in 35 IAC 840.126. One of the Meredosia Power Station Ash Ponds was closed using the ClosureTurf® system.

Conventional final cover will require grading of the CCR surface to promote positive drainage, placement of 40-mil HDPE or LLDPE geomembrane along with welding the geomembrane panels together and bringing sufficient soil on-site to cover both ash ponds (approximately 350,000 cu. yds.). It will also require equipment to handle and place the cover soil over the geomembrane. Using the ClosureTurf® system would not require placement of 3 feet of protective soil, and therefore reduces the time needed to place final cover.

9.1.1.1 Timeframe

Dewatering, grading, and placement of a conventional final cover system on both ash ponds should require approximately 2 to 2.5 years to complete for a conventional cover system. The ClosureTurf® system should only need the time to dewater, grade the CCR for positive drainage, placement and welding of the

[†] The Illinois CCR Rules [35 IAC 845.750(c)] for final cover requires 3 feet of low permeability material versus the 18 inches required by 40 CFR 257.102(d)(3). Closure activities will need to be performed following the Illinois CCR Rules.

geomembrane, placement of the engineered turf, and addition of the aggregate infill material. This should reduce the time to 1.25 to 1.75 years.

Note that these timeframes do not take into consideration the amount of time the Illinois EPA will need to complete review of the construction permit application and issue a final permit.

9.1.1.2 Implementation

Closure-in-Place should be straight forward. Grading of the CCR for positive drainage is traditional earthwork and installation of the dewatering wells and associated pipe and electrical work is also non-complex. The major difference in the two (2) final cover systems is the volume of protective soil needed for the conventional final cover, hence the need for the additional 0.75 years to place this material.

9.1.1.3 Performance

Closure-in-Place will have several performance-based solutions to retard/restrict migration of contaminants to the environment. These solutions include dewatering systems to reduce free water in the impoundments during and after closure, contouring the CCR to provide positive drainage, and installation of a final cover system compliant with 40 CFR 257.102(d).

9.1.1.4 Safety and Health Impacts

The greatest potential safety and health issue is fugitive dust. Running equipment over the CCR could dry the material and allow it to become airborne. Keeping the CCR moist would reduce the ability of the CCR to be transported by wind. Tracking CCR offsite should not be an issue for the Closure-in-Place scenario as truck traffic is going to be limited to bringing in soil from off site, and trucks will typically not be running over the CCR surface.

9.1.1.5 Best Management Practices

Best management practices (BMPs) will be used to mitigate potential safety and health risks. These include items like watering roadways, keeping the working CCR areas moist, and avoiding tracking CCR on interior and public roads.

9.1.1.6 Feasibility

Closing both ash ponds in place is feasible, but there are disadvantages over some of the other closure alternatives. Grading, dewatering, and final cover construction for both DAP and LAP will be more time-consuming than other alternatives. Fugitive dust from both units would also add additional health and safety risks.

9.1.2 Removal of CCR for Beneficial Use

Utilizing CCR for projects in Illinois presents both potential advantages and significant risks. Economically, using CCR as a fill material *can* be significantly cheaper than transporting conventional materials, particularly if sourced to a nearby location. This practice would also reduce or eliminate the expenses associated with closing and maintaining dedicated CCR landfills and/or impoundments.

The Illinois Environmental Protection Act (ICS, 2023) provides the following definition for beneficial use of Coal Combustion By-products (CCB) in Section 3.135:

415 Ill. Comp. Stat. 5/3.135 (2023)
Sec. 3.135. Coal combustion by-product; CCB.
(a) "Coal combustion by-product" (CCB) means coal combustion waste when used beneficially in any of the following ways:
(1) The extraction or recovery of material compounds contained within CCB.
(2) The use of CCB as a raw ingredient or mineral filler in the manufacture of the following commercial products: cement; concrete and concrete mortars; cementious products including block, pipe and precast/prestressed components; asphalt or cementious roofing products; plastic products including pipes and fittings; paints and metal alloys; kiln fired products including bricks, blocks, and tiles; abrasive media; gypsum wallboard; asphaltic concrete, or asphalt based paving material.
(3) CCB used (A) in accordance with the Illinois Department of Transportation ("IDOT") standard specifications and subsection (a-5) of this Section or (B) under the approval of the Department of Transportation for IDOT projects.
(4) Bottom ash used as antiskid material, athletic tracks, or foot paths.
(5) Use in the stabilization or modification of soils providing the CCB meets the IDOT specifications for soil modifiers.
(6) CCB used as a functionally equivalent substitute for agricultural lime as a soil conditioner.
(6.5) CCB that is a synthetic gypsum that:
(A) has a calcium sulfate dihydrate content greater than 90%, by dry weight, and is generated by the lime or limestone forced oxidation process;
(B) is registered with the Illinois Department of Agriculture as a fertilizer or soil amendment and is used as a fertilizer or soil amendment;
(C) is a functionally equivalent substitute for mined gypsum (calcium sulfate dihydrate) used as a fertilizer or soil amendment;
(D) is used in accordance with, and applied at a rate consistent with, documented recommendations of a qualified agricultural professional or institution, including, but not limited to any of the following: certified crop adviser, agronomist, university researcher, federal Natural Resources Conservation Service Conservation Practice Standard regarding the amendment of soil properties with gypsum, or State-approved nutrient management plan; but in no case is applied at a rate greater than 5 dry tons per acre per year; and
(E) has not been mixed with any waste.
(7) Bottom ash used in non-IDOT pavement sub-base or base, pipe bedding, or foundation backfill.
(8) Structural fill, designed and constructed according to ASTM standard E2277-03 or Illinois Department of Transportation specifications[‡], when used in an engineered application or combined with cement, sand, or water to produce a controlled strength fill material and covered with 12 inches of soil unless infiltration is prevented by the material itself or other cover material.
(9) Mine subsidence, mine fire control, mine sealing, and mine reclamation.

[‡] The combination of all known transportation projects in the area requires less than CWLP's volume of CCR available beneficial use.

The greatest issue with beneficial use is the opportunity to have a destination in need of a great volume of CCR at any given time. CWLP is continuing to investigate opportunities for beneficial reuse of CCR.

9.1.2.1 Timeframe

With approximately 2,782,000 cu. yd. of CCR and other materials in DAP and LAP, using the CCR for beneficial use in finite volumes would require multiple years for all the CCR to be removed. A review of all current and planned major transportation related projects over the span of the next 10 years would not require the amount of material available. Items 8 and 9 in the CCB Beneficial Use definition are the two most likely ways to use most, if not all, the CCR at CWLP.

9.1.2.2 Implementation

Removing the CWLP CCR would require finding either a large Illinois Department of Transportation construction project or getting a permit from Illinois Department of Natural Resources, Mines and Minerals for use at mine sites.

9.1.2.3 Performance

Removal of CCR eliminates the likelihood of any further CCR contamination impacting groundwater.

9.1.2.4 Safety and Health Impacts

Fugitive dust would be an issue as equipment and trucks move over the CCR. Keeping the CCR moist could reduce the ability of the CCR to be transported by wind.

Tracking CCR offsite becomes an issue for any beneficial use scenario. Limiting truck traffic on the CCR may not be practical for loading and moving the CCR off site. Additionally, tracking the CCR onto public roads becomes a BMP issue.

Traffic accidents and driver errors could also cause CCR spills on the way to the beneficial use location.

9.1.2.5 Best Management Practices

Best management practices (BMPs) will be used to mitigate potential safety and health risks. These include items like watering roadways, keeping the working CCR areas moist, and using tire wash stations to prevent tracking CCR on interior and public roads.

9.1.2.6 Feasibility

Beneficial use of the CCR is likely the least feasible of the closure alternatives. The limited IDOT or mine reclamation projects are the limiting factor. Additional health and safety issues, including tracking CCR on public roads and the potential for trucking accidents, add to limiting the feasibility of this option.

9.1.3 Closure-By-Removal to Another Disposal Unit

Closure-by-Removal to another disposal unit would remove any CCR and other impacted materials from both the DAP and LAP. Removal could not take place until both ash ponds were dewatered. As noted in Section 9, dewatering LAP will take almost one (1) year and Table 1 indicates that LAP CCR will still retain a significant volume of water even after dewatering. Additionally, the ash ponds would remain in an open condition and continue to receive precipitation that would need to be managed during removal.

The Closure Plan for the Unit 2 Landfill was updated in July 2025 (AEI, 2025a). It only discusses closure of the 3-acre active area, and not the entire footprint of Unit 2 Landfill. Note that the Closure Plan describes a net, in place disposal capacity of 1,162,275 cu. yds., which is less than half the combined volumes of DAP and LAP.

Under the Illinois Landfill Rules (35 IAC 810-814), waste streams must show that they contain no characteristic hazardous materials and pass a paint filter test. With the high field capacity values identified in Table 1 it is problematic that the wastes could pass the paint filter test in a gravity drained condition.

Additionally, US EPA was informed by correspondence dated 7 May 2024 from ArentFox Schiff LLC that CWLP has no plans for expansion beyond the current footprint of the active area of Phase I of Cell 3.

9.1.3.1 Timeframe

Hanson estimates that both ash ponds contain approximately 2,782,000 cu. yd. of CCR and other materials. This would require approximately 111,000 truckloads (at 25 cu. yd. per truck). Running 9.5 hours[§] a day Monday through Friday, assuming 50 trucks per day entering and exiting the facility, DAP and LAP could have all the CCR removed in approximately 9.0 years.

Note that this time estimate does not include time that may be needed to permit and construct a new disposal facility through Illinois EPA, Bureau of Land. In the past, this process has required anywhere from 2.5 to 4 years. The Environmental Protection Act (ICS, 2023) allows the Bureau of Land to take up to 180 days to review a new landfill permit application. Several rounds of review comments and responses add to the time before a permit can be issued.

Once the landfill permit is issued, construction of the disposal facility can begin. This construction could take up to one year. Total time for this option can range from 9.5 to 11.5 years. Note that the requirements of 25 IAC 845.700 could impact the timeframe of the ash ponds closure.

9.1.3.2 Implementation

It is possible to transport the CCR to an existing municipal solid waste landfill. Appendix D contains the 2023 landfill capacity information for the two central Illinois regions (Region 4 – East Central Illinois and Region 5 – West Central Illinois) that would be closest to the CWLP ash ponds. Although several landfills have capacity to take all the CWLP CCR, it will consume a large percentage of available air space or consume all available air space. It is unlikely that the landfills, their siting authorities, or the county will

[§] Daily hours were reduced from 12 hours to 9.5 hours based on actual operating hours for several local municipal solid waste landfills. The truck count was also reduced due to the shorter operating hours.

allow for all the available air space (or even a significant portion) to be consumed if siting agreements have expectation of how long the landfill needs to have available capacity.

Note that the Illinois Solid Waste Planning and Recycling Act (SWPRA) is a State of Illinois Law (425 ILCS 15/) which requires that every county manages the solid wastes generated within its boundaries. This includes knowing the waste types generated over the next 20 years and time estimates for the development and operation of each proposed facility or program. This is where local authorities can restrict the volume of CCR that could be disposed at a given landfill if it affects the SWPRA.

9.1.3.3 Performance

Removal of CCR also eliminates the likelihood of any further CCR contamination impacting groundwater. However, removal to another disposal unit requires available air space and/or time to permit and construct another location.

9.1.3.4 Safety and Health Impacts

Fugitive dust would be an issue as equipment and trucks move over the CCR. Keeping the CCR moist could reduce the ability of the CCR to be transported by wind.

Tracking CCR offsite becomes an issue for any Closure-by-Removal scenario. Limiting truck traffic on the CCR may not be practical for loading and moving the CCR off site. Additionally, tracking the CCR onto public roads becomes a BMP issue.

Traffic accidents and driver errors could also cause CCR spills on the way to the disposal facility.

9.1.3.5 Best Management Practices

Best management practices (BMPs) will be used to mitigate potential safety and health risks. These include items like watering roadways, keeping the working CCR areas moist, and using tire wash stations to prevent tracking CCR on interior and public roads.

9.1.3.6 Feasibility

Moving the CCR to a new disposal site also has limited feasibility. The limited amount of current landfill airspace or the time needed to permit a new disposal site through Illinois EPA limits the desirability of this option. This also has the same health and safety concerns that the beneficial use option has.

9.1.4 Waste Consolidation

Consolidation of the waste material from LAP into DAP into one (1) facility offers several potential benefits.

1. A properly engineered facility can ensure a controlled environment for the long-term management of CCR waste material.
2. The consolidation effort will allow for improved containment and a dewatering system to limit the potential for groundwater contamination.
3. The design can better control issues such as berm failures and erosion by planning for and managing stormwater impacts at the site.

4. Consolidating LAP will expose the downstream side of Spalding Dam and allow for better evaluation of potential hazards during dam inspections.
5. Consolidation of the waste would simplify the long-term monitoring of groundwater, unwaters/dewaters, and ongoing maintenance due to a reduced footprint.

Challenges associated with the waste consolidation will not be inconsequential. Care will need to be taken to move a large amount of material in a safe and environmentally responsible manner. The LAP CCR would not be dewatered before being moved. The wetter nature of the CCR will facilitate moving it to DAP more efficiently and allow it to dewater in geotextile tubes. This long-term management would include continued operation of the dewatering system to reduce the potential for contaminant migration from the DAP.

Once the LAP CCR is consolidated at DAP, a final cover system will be placed to prevent infiltration and accumulation of contact waters within the DAP footprint. The closure options are the same as described in Section 9.1.1. Concept drawings consolidating LAP to DAP are shown in Appendix G. Additionally, once the LAP CCR is removed, soil sampling within the former LAP footprint will be performed to verify that contaminated soils do not exist within the LAP footprint.

9.1.4.1 Timeframe

Consolidation would begin by dewatering DAP, which should take about 150 days. Once DAP is dewatered and settlement begins, material at LAP can begin to be sluiced and stored in geotextile bags. The sluiced and bagged CCR would then be dewatered at DAP. Sluicing the LAP CCR and bagging the material will take 1 year (10-hour workdays, 5 days/week with 2 pumps at 3,000 gpm). Dewatering and settlement will take another 3-6 months. Additional earthwork to prepare for final cover and final cover placement will be another 6 months. Total time to consolidate LAP to DAP will take a total of 2 to 2.5 years.

9.1.4.2 Implementation

Grading of the DAP CCR to be able to place the geotextile bags and installation of the dewatering wells and associated pipe and electrical work is not a complex construction process. Filling the geotextile bags will require some coordination at DAP to make the process efficient. Care will need to be taken in backfilling over the geotextile bags to create a smooth surface for the final cover system without damaging the geotextile bags.

9.1.4.3 Performance

Consolidation will have similar performance goals as the Close-in-Place alternative for DAP and closure by removal for LAP. Consolidation will also retard/restrict migration of contaminants to the environment. These solutions include the dewatering system to reduce free water in the impoundments during and after closure, contouring the CCR to provide positive drainage, reducing the footprint of the impoundment, and installation of a final cover system compliant with 40 CFR 257.102(d).

9.1.4.4 Safety and Health Impacts

Fugitive dust will likely only be an issue during the DAP grading process. A combination of hauling the dryer CCR materials and sluicing the wet CCR will be used to move the LAP CCR to DAP. There should not be any offsite tracking of CCR in this Consolidation scenario.

9.1.4.5 Best Management Practices

Best management practices (BMPs) will be used to mitigate potential safety and health risks. These include items like watering roadways, keeping the working CCR areas moist, and avoiding tracking CCR on interior and public roads. Additional care will need to be provided while CCR is being sluiced to avoid discharges of the sluiced CCR and sluice lines becoming disconnected from the geotextile bags.

9.1.4.6 Feasibility

Waste consolidation is likely the most feasible alternative available. Benefits include reducing the waste footprint, all work is performed on site, and sluicing the LAP CCR helps reduce the fugitive dust issue. The amount of time to complete closure is no worse than any of the other alternatives.

9.2 Ancillary Alternatives

This ancillary alternative section discusses additional mitigation/remediation alternatives that could be used in conjunction with a final cover system or CCR removal.

9.2.1 Cut-off Wall

An alternative that could be utilized with many of the listed (non-removal) remedies is a cut-off wall surrounding either or both CWLP ash ponds. The slurry wall would be constructed along the inside edge of the ash pond berm using traditional excavation equipment. The excavation would be flooded with bentonite slurry, creating a barrier with low permeability, and the trench would be excavated and keyed into the shale bedrock beneath the Basal Sand Unit. The trench would surround the ash pond(s) and restrict the ability of contaminants to impact groundwater. The addition of the dewatering wells would prevent the buildup of precipitation within the footprint of the ash pond until a final cover system can be placed over the CCR.

9.2.1.1 40 CFR 257.97 Requirements

- Protective of human health and the environment – Yes, cut-off walls restrict the migration of contaminants and the movement of contaminated groundwater.
- Attain the GW protection standards – May require an additional alternative to meet the GW protection standards.
- Control the source(s) of releases – Yes, the cut-off wall restricts contaminant releases.
- Remove from the environment as much of the contaminated materials as possible – The cut-off wall will incase the contamination and prevent it from being released into the environment.
- Wastes shall be managed in a manner that complies with all applicable RCRA requirements – Yes, 40 CFR 257 meet the requirements for a RCRA Subtitle D waste disposal unit.

9.2.1.2 Performance

The cut-off wall is used to restrict migration of contaminant from a CCR impoundment to groundwater. The low permeability of the bentonite slurry combined with dewatering of the CCR reduces the flow of contaminants from inside the impoundment to the aquifer on the outside of the cut-off wall. Placement of

a final cover system compliant with 40 CFR 257.102(d) will restrict further infiltration of precipitation and preventing any further potential contaminant migration from the CCR unit.

9.2.1.3 Timeframe

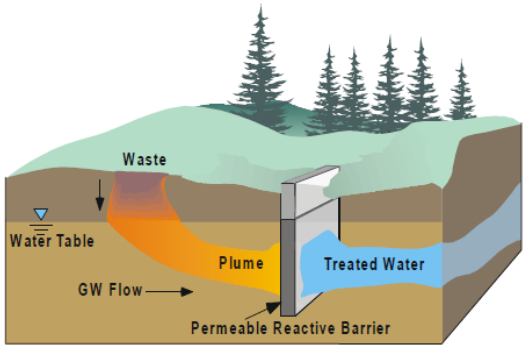
Once dewatering of the CCR is completed, Hanson estimates that the cut-off wall could be constructed at each ash pond in less than 6 months excavating 30 to 50 linear feet of trench per day.

9.2.1.4 Implementation

The cut-off wall could be constructed any time before the placement of the final cover system.

9.2.1.5 Safety and Health Impacts

There should be nominal safety and health impacts to this alternative since the excavation is flooded with bentonite slurry and there would be nominal truck traffic moving around the Site. The excavated materials would be placed on the ash pond and graded for positive drainage.



9.2.1.6 Best Management Practices

Best management practices (BMPs) are limited to working near the excavation and the in-place bentonite slurry. The slurry will remain soft even after placement, so pedestrian and vehicle traffic should be avoided. Access roads will need to be constructed at various locations around the ash pond to allow access to the ash pond interior.

9.2.1.7 Feasibility

Of the ancillary alternatives, the cut-off wall is one of the more feasible options. The bentonite slurry aids in keeping the excavation open, the excavation can double as the anchor trench for the final cover system, and it has a rather quick completion time. This has also been a time-tested solution to restrict contaminant migration.

9.2.2 Permeable Reactive Barriers

A Permeable Reactive Barrier (PRB) is an in-situ groundwater remediation technology that involves installing a reactive material within the subsurface to intercept a plume of contaminated groundwater. As the groundwater flows passively through the barrier under the existing hydraulic gradient, the contaminants are removed or transformed through physical, chemical, or biological processes. PRBs are particularly applicable in situations where a defined plume of dissolved contaminants is migrating in a predictable flow path within a permeable aquifer. They can be a cost-effective and sustainable solution for treating groundwater contamination downgradient of a source area, preventing further migration and reducing contaminant concentrations to acceptable levels without requiring continuous energy input for pumping and treating groundwater.

A PRB installed at the CCR impoundments would need to intersect the surrounding confined Basal Sand Unit, which varies in depth from 25 to 55 feet below the existing ground surface. Additionally, it would need to be designed to treat the Appendix IV constituents of concern (CoCs) found within DAP and with sufficient reactive material to provide for potential depletion over time to ensure reliable performance of the PRB.

Implementing a PRB within the confined Basal Sand Unit at a depth of 25 to 55 feet presents considerable challenges. Installation via trenching or injection carries the risk of creating preferential flow pathways to the aquifer. Furthermore, ensuring complete and continuous interception of the <1.0 to 18.5 feet thick aquifer at this depth to effectively capture all contaminant movement may be technically difficult, potentially rendering the PRB an unreliable remedy.

9.2.2.1 40 CFR 257.97 Requirements

- Protective of human health and the environment – Yes, PRBs remove contaminants from groundwater.
- Attain the GW protection standards – Good for removing trace metals and various organic compounds. Not well suited for cation removal.
- Control the source(s) of releases – No, PRBs do not control releases, they treat groundwater.
- Remove from the environment as much of the contaminated materials as possible – No, the contaminated materials are retained within the reactive materials.
- Wastes shall be managed in a manner that complies with all applicable RCRA requirements – Yes, 40 CFR 257 meet the requirements for a RCRA Subtitle D waste disposal unit.

9.2.2.2 Timeframe

Installation time for a PRB should be similar to the installation of the Cutoff Wall (<6 months). However, the Cut-off Wall is a long-term solution for the impacted groundwater.

9.2.2.3 Implementation

The PRB could be constructed any time before the placement of the final cover system. Several references cite heavy metal cleanup with PRB (Blowes et al., 2000, Hashim et al., 2011). Blowes et al. (2000) lists several inorganic parameters that have treatment potential and cites small scale field testing for Cd, Cr, Cu, Fe, Ni, Pb, NO_3, PO_4, and SO_4. Ahn et al. (2003) indicated that steel manufacturing byproducts could remove high concentrations of Arsenic (25 mg/L) in bench tests. Powell et al. (1998) listed Cobalt as removable via PRB.

Excavating the trench for the installation of the reactive materials could be difficult. Removing the Basal Sand Unit without a slurry to keep the trench open will be problematic at the depths observed around the ash ponds.

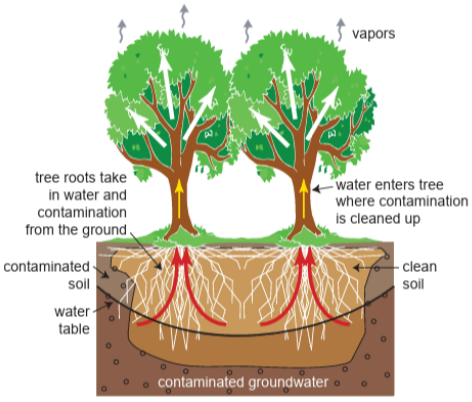
9.2.2.4 Performance

Although PRBs have been shown to be an effective remediation technology for organic contaminants, the effective treatment of many CCR parameters is unknown. While zero valent iron treatment is effective for several metals, including Arsenic, Chromium, and Selenium, there is no indication of its effectiveness for

other CCR parameters, like Boron, Chloride, and many of the Appendix IV metals (ITRC, 2011). This coupled with the depths that must be reached at DAP and LAP would preclude this alternative from being an effective solution.

9.2.2.5 Safety and Health Impacts

There should be nominal safety and health impacts to this alternative since the excavation is backfilled with reactive material and there would be nominal truck traffic moving around the Site. The excavated materials would be placed on the ash pond and graded for positive drainage. However, care will be needed to ensure that the reactive material does not pose a human health hazard.



9.2.2.6 Best Management Practices

Best management practices (BMPs) are limited to working near the excavation and the in-place reactive material. Access roads may need to be constructed at various locations around the ash pond to allow access to the ash pond interior.

9.2.2.7 Feasibility

A PRB is one of the less feasible ancillary alternatives available. Of greatest concern is the excavation of the aquifer material at the depth found on site and being able to replace the aquifer with the reactive barrier materials.

9.2.3 Phytoremediation

Phytoremediation is an in-situ remediation technology that utilizes the natural abilities of plants to remove, stabilize, or transform contaminants in soil, sediment, and water. Through various mechanisms such as uptake, accumulation, degradation, and immobilization, carefully selected plant species can help to mitigate the environmental impact of pollutants.

However, the depth to groundwater at the site makes the use of phytoremediation problematic. Phytoremediation is generally not effective for all CCR constituents, which would possibly necessitate the use of additional remediation techniques. Additionally, many plant species in our climate zone go dormant during the fall and winter months, making them ineffective for year-round groundwater cleanup. The depth of the aquifer, in conjunction with the time required for root systems to reach the aquifer, combined with the climate, effectively precludes phytoremediation as an effective remediation technique for the DAP.

9.2.3.1 40 CFR 257.97 Requirements

- Protective of human health and the environment – Yes, Phytoremediation can remove contaminants from groundwater, but at CWLPs aquifer depth it can be problematic.
- Attain the GW protection standards – Possibly, but with a dormant winter season it would not be year-round effective.

- Control the source(s) of releases – No, Phytoremediation does not control releases, it treat groundwater.
- Remove from the environment as much of the contaminated materials as possible – No, the contaminated materials are retained within the treatment plants.
- Wastes shall be managed in a manner that complies with all applicable RCRA requirements – Yes, 40 CFR 257 meet the requirements for a RCRA Subtitle D waste disposal unit.

9.2.3.2 Timeframe

Planting the appropriate plant species should be a relatively short timeframe (<6 months). However, the time needed for the plants to mature and become effective would take several years.

9.2.3.3 Implementation

Phytoremediation could be constructed any time before the placement of the final cover system and could be implemented in a short timeframe. It is also likely that Phytoremediation will not be effective against several of the CCR parameter, including Boron, Chloride, and Sulfate. Having the Phytoremediation system active for only part of the year also makes the system problematic.

9.2.3.4 Performance

Phytoremediation can assist in remediation of certain contaminants. However, this remediation technique is a near-surface process, whereby the plants take up groundwater and contaminants leaving behind clean soil. This type of remediation would potentially require a large amount of space, which does not exist where Sugar Creek and DAP and LAP are located. This area is also prone to flooding when water needs to be released from Lake Springfield.

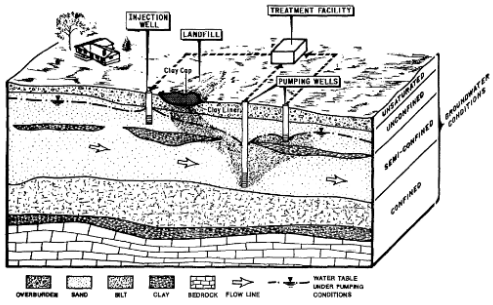
Additionally, the CCR parameters would likely require multiple species to remediate all the potential contamination (if possible). Plants that absorb the contamination would also need to be properly managed to prevent re-introduction of the contaminants back into the environment. Also, due to the depth of the BSU, this treatment system would need to be coupled with an extraction system to get the contaminated groundwater closer to the surface for treatment.

9.2.3.5 Safety and Health Impacts

There should be nominal safety and health impacts to this alternative, since it only requires the planting of appropriate plant species.

9.2.3.6 Best Management Practices

Best management practices (BMPs) would be nominal. The most important practice would be to keep undesirable plant species out of the remediation area to prevent reduced uptake of the contaminants or crowding out of the desired plant species.



9.2.3.7 Feasibility

Phytoremediation is also a less feasible alternative than other presented alternatives. The biggest drawback is the depth of the uppermost aquifer and the ability of the vegetation to reach the 40-50-foot

depths needed to implement this alternative. The climate in central Illinois also limits phytoremediation because of vegetation dormancy in the late fall and winter.

9.2.4 Pump and Treat

Pump and Treat (P&T) involves the extraction of contaminated groundwater from the subsurface using a system of wells or drains, followed by ex-situ treatment of the extracted water to remove the targeted contaminants. The treated water may then be discharged to surface water, a publicly owned treatment works, or reinjected back into the aquifer. P&T aims to hydraulically control the migration of contaminated groundwater and reduce contaminant mass in the aquifer over time through continuous extraction and treatment.

Extraction wells would be installed downgradient of the DAP where the contaminants would be removed from the extracted groundwater via treatment (precipitation, coagulation/flocculation, sedimentation, filtration, ion exchange, reverse osmosis, or activated carbon). Treatability of Arsenic is well documented in Kanel et al. (2023). Cobalt can also be removed from groundwater. Treatment processes include chemical precipitation (using hydroxides), ion exchange (using exchange resins), and membrane filtration (using reverse osmosis (RO)). Other treatment options are also available, but may be less effective (Lenntech, 2025).

Risks involved with P&T would be the possibility of pumping within the Basal Sand Unit drawing groundwater from the DAP, through the Lower Cohesive Unit, and further leaching additional contaminants into the aquifer. Additionally, treatment of the groundwater can result in new solid wastes that require disposal. P&T primarily addresses dissolved contaminants, and there is a potential for residual contamination sorbed to the aquifer matrix to slowly desorb resulting in the rebound of contaminant concentrations.

9.2.4.1 40 CFR 257.97 Requirements

- Protective of human health and the environment – Yes, P&T restrict the migration of contaminants and the movement of contaminated groundwater..
- Attain the GW protection standards – Yes, with the proper treatment system the P&T system should allow groundwater to meet the relevant standards.
- Control the source(s) of releases – No, P&T does not control releases, it treats groundwater. However, in conjunction with another alternative (i.e., cut-off wall) which would control releases.
- Remove from the environment as much of the contaminated materials as possible – Yes, the contaminated materials are removed by the treatment system for disposal at permitted facility.
- Wastes shall be managed in a manner that complies with all applicable RCRA requirements – Yes, 40 CFR 257 meet the requirements for a RCRA Subtitle D waste disposal unit.

9.2.4.2 Timeframe

Installation of the extraction wells, construction of the header system and electrical layout, and the installation of the necessary treatment devices should take approximately 6 to 8 months. The P & T system would operate until the concentrations of Arsenic and Cobalt were below the groundwater protection standards.

9.2.4.3 Implementation

Some initial study would be necessary to determine the appropriate spacing of the P&T extraction wells along with designing the header system, the electrical layout, and designing the size and type of remediation treatment system(s). Long-term use of the P&T will require normal maintenance and disposal of any accumulation of treatment sludges or wastes.

9.2.4.4 Performance

A Pump and Treat system will need to address the depths necessary to reach the BSU (25 to 55 feet). A french drain system would be impractical to install at depth, so wells will be needed to remove impacted groundwater. Treatment of many of the Appendix IV parameters should be straight forward, but many of the treatment methods generate a waste stream that must be properly disposed (e.g., precipitation, RO, etc.).

9.2.4.5 Safety and Health Impacts

There should be nominal safety and health impacts to this alternative, but some of the treatment sludges and wastes could have adverse health impacts. Proper personal protective equipment (PPE) could be needed when personnel are exposed to these waste products.

9.2.4.6 Best Management Practices

Best management practices (BMPs) should be limited to the use of PPE when performing regular maintenance on the P&T equipment.

9.2.4.7 Feasibility

Pump and treat could be a feasible alternative, but there are two issues that could impact feasibility. These issues include the long-term need to pump groundwater to reach the necessary concentrations and the need to regenerate treatment resins or dispose of treatment sludges.

10. Nature and Estimated Quantity of Material Released [Attachment 1, Item 7]

No CCR material has been released from Dallman or Lakeside Ash Ponds. The estimated quantity of constituents that have potentially been released to groundwater is discussed in the 2026 Addendum to the Nature and Extent Report provided in Appendix C.

11. Natural Attenuation [Attachment 1, Item 8]

Natural Attenuation or Monitored Natural Attenuation uses several processes to remove or aid in removal of contaminants migrating in groundwater. The processes of natural attenuation include biodegradation, chemical reactions, dilution, evaporation, and sorption.

Several of these processes will not be successful in cleaning up CCR impacted groundwater. Biodegradation, chemical reactions, and sorption require that the cation or anion impacting groundwater can interact with whatever exists in the soil/groundwater system or with some other additives used to attenuate the migration of the CCR contaminant(s). Evaporation can work with volatile compounds, but inorganic cations and anions will be left behind once the groundwater has evaporated and potentially dissolved back into the aquifer once additional fresh water is added to the system. Sorption and dilution

are the two most likely treatment options. Dilution simply requires sufficient fresh water input to the system to lower the concentrations of CCR parameters. Sorption can be a useful treatment method for several of the CCR metals, but the soil minerology needs to contain compounds to which the metal ions can bond and the appropriate Eh/pH conditions to allow the solid-phase components to precipitate.

Hanson does not recommend the use of natural attenuation for the ash pond closures. The distance from the ash ponds to Sugar Creek is small, reducing the volume of soil needed for such attenuation to occur.

12. Sugar Creek Flood Event and Ecological Risk [Attachment 1, Item 9]

A database check from the Illinois Department of Natural Resources Ecological Compliance Assessment Tool (EcoCAT) reported that only one protected species may be in the vicinity of the project location: Kirtland's Snake (*Clonophis kirtlandi*). The US Fish and Wildlife Service Information for Planning and Consultation (IPaC) listed the Indiana bat (*Myotis sodalist*) *as* endangered, and the eastern prairie fringed orchid (*Platanthera leucophaea*) as threatened.

A field visit was completed on April 16, 2025 to observe the conditions of Sugar Creek within the vicinity of the DAP and LAP. The Site visit determined that suitable habitat for the listed endangered and threatened species exist within and surrounding Sugar Creek. See Appendix F for Hanson's Habitat Assessment Memo, EcoCAT results and IPaC results.

Hanson has reviewed the Illinois Environmental Protection Agency (EPA) Integrated Water Quality Report and Section 303(d) List for several biennial reporting periods (2010-2026) as shown in Appendix H. The section of Sugar Creek (Assessment Unit ID IL_EOA-01) that flows past LAP and DAP has historically been impaired (2010-2024). However, the draft 2026 Report indicates that the subject section of Sugar Creek now fully supports aquatic life use and fully supports aesthetic quality use. As such, no additional investigations were deemed necessary.

To evaluate flood events along Sugar Creek, the velocity of the flood flows was compared to the permissible velocities of vegetative linings to represent the existing berms around the Dallman and Lakeside Ash Ponds. Fischenich (2001) was used to determine the permissible velocities of the existing vegetative cover. Table 2 (Fischenich, 2001) lists the Permissible Shear and Velocity for Selected Lining Materials, including vegetative turf covers. These turfs were separated into classes A, B and C. These classifications are described in "Design or Roadside Channels with Flexible Linings" (FHA, 2005). Table 4.1 provides vegetative species and coverage conditions to determine the retardance class of the cover system. These tables are included in Appendix F. Based on field observations of the existing vegetation along the Lakeside and Dallman berms, retardance class B was selected, providing permissible maximum velocities of between 4 and 7 ft/sec.

Hanson utilized the August 2, 2007 Federal Emergency Management Agency (FEMA) Flood Insurance Study (FIS) Number 17167CV000B for Sangamon County, Illinois for flood volume information. The document provided the 100-year peak discharge for Sugar Creek at Spaulding Dam of 27,800 cubic feet per second (CFS) at an elevation of 545 NAVD88. This data was based on topography of the project area that did not include the construction of the LAP or DAP, which incorrectly identifies these areas as being within the flood zone. Additionally, there are three (3) culverts that discharge water beneath Interstates 55/72. These culverts have a minor drainage area (approximately 37 acres) relative to the discharges from Lake Springfield.

This information was used to approximate the flood elevation based off lidar elevations from 2023, velocity for the 100-year storm and to project that information for a 1,000-year storm event. Bonnin et al. (2006) precipitation frequency estimates for the project location in Springfield, IL was used to escalate the 100-year storm to the 1,000-year storm. This document is included in Appendix F and shows the 100-year storm precipitation rate of 6.22 inches and the 1,000-year rate of 8.38 inches. This represents a 35% increase in the potential inflow volume and would result in a 1,000-year outflow volume of 37,454 CFS.

Appendix F includes a cross section that summarizes an evaluation of the floods to provide a range of potential elevations and velocities that could be present for the 100 and 1,000-year events. The evaluation began with holding the 100-year elevation of 545, the outflow volume of 27,800 CFS to calculate a velocity of 0.9 ft/sec based off the area presented in the cross section. This elevation was held, and velocity increased to 6.2 ft/sec to maintain the flow volume based on the new lidar topography. Maintaining the cross-sectional area and 100-year flow velocity was also held for another review, but the elevation increased to 560.18. These two approaches were then averaged to result in an elevation of 552.59 with a 100-year velocity of 3.5 ft/sec. The same process was repeated with the projected 1,000-year flow volume. The highest velocity that can be seen is holding the elevation of 545 for the 1,000-year storm at 8.3 ft/s. This approach is likely overconservative, and the current channel geometry produces higher water elevations and lower velocities, most like the averages of 3.5 ft/sec for the 100-year storm and 4.8 ft/sec for the 1,000-year storm.

Using the maximum permissible velocities of the existing vegetative lining in the range of 4 to 7 ft/sec. and the expected flood velocities within or below that range, there should be no erosion of the existing berms. With there being no concern of erosion of the existing berms that would predicate a release of material, there is minimal ecological risk to Sugar Creek based on the 100-year or 1,000-year flood events.

13. ACM Placement in Operating Record [40 C.F.R. §§ 257.96(d)]

CWLP will place the completed ACM in the facility's operating record upon completion.

14. Public Meeting [40 C.F.R. §§ 257.96(e)]

CWLP will discuss the results of the ACM at least thirty (30) days prior to the selection of remedy, in a public meeting with interested and affected parties.

15. Recordkeeping [40 C.F.R. §§ 257.96(f)]

CWLP will comply with the recordkeeping requirements for ACM as specified in 40 C.F.R. §§ 257.105(h), the notification requirements specified in 40 C.F.R. §§ 257.106(h), and the Internet requirements specified in 40 C.F.R. §§ 257.107(h).

16. Conclusion

Hanson has outlined several closure methods and ancillary (supporting) alternative for mitigating releases of impacted groundwater from CWLP's DAP and LAP that will be protective of human health and the environment, attain the groundwater protection standards, control the source to reduce or eliminate further releases to the environment and remove from the environment as much of the contaminated material as feasible. Hanson recommends that several of these solutions be used in conjunction with each other to meet the requirements of 40 CFR 257.96(a) and 257.97(b). These alternatives include:

1. Install the dewatering well system.
2. Consolidate the LAP CCR into DAP.
3. Construct a cut-off wall at least around DAP.
4. Install a final cover using the ClosureTurf® system.
5. Eventually, install a pump and treat system to manage releases outside the DAP cut-off wall.

1. INTRODUCTION

The original Nature and Extent Report (June 11, 2025) was prepared on behalf of City Water, Light and Power (CWLP) pursuant to Paragraphs 268 and 270 of the Consent Agreement and Final Order (CAFO), effective January 14, 2025 and the requirements of 40 CFR 257.95(g). This revised report augments the initial report with additional information requested by the EPA in communication with CWLP. This report continues to address the Appendix IV constituents exhibiting Statistically Significant Levels (SSLs) identified in the February 13, 2025 Groundwater Protection Standards Report (GWPS Report) for the parameters arsenic (total) at wells RW-3, AP-7, AP-8, and AW-1 and cobalt (total) at wells AP-2 and AP-3.

2. BACKGROUND

CWLP owns and operates two existing coal combustion residuals (CCR) surface impoundments, identified as Lakeside Ash Pond and Dallman Ash Pond. The CWLP CCR surface impoundments are located north and east of the former Lakeside Power Generating Station and Dallman Power Generating Station in the Eastern ½ of Section 12, Township 15 North, Range 5 West, in Springfield, Illinois (see Figure 1). The subject of this submittal, the CCR surface impoundments, are identified as the Lakeside Ash Pond and the Dallman Ash Pond and will be closed.

The former Lakeside Power Generating Station and Dallman Power Generating Station are situated on the northwestern bank of Lake Springfield in Springfield, Illinois. The Lakeside Ash Pond is immediately north of Spaulding Dam at the northern end of Lake Springfield (see Figure 2). The Dallman Ash Pond is immediately northwest of the Lakeside Ash Pond. Placed into service prior to 1958, the Lakeside Ash Pond is primarily a diked embankment with an in situ soil liner. The Lakeside Ash Pond consists of four separate ponds (i.e., three lime softening ponds and a settling pond) totaling approximately 35.0 acres. The Lakeside Ash Pond ceased receiving ash in 2009. The Dallman Ash Pond was placed into service in approximately 1976 and is also a diked embankment with an in situ soil liner. The Dallman Ash Pond is approximately 34.5 acres in area and ceased receiving CCR materials in 2023.

The Lakeside Ash Pond historically received lime sludge from the CWLP Drinking Water Purification Plant and scrubber wastewater treatment plant clarifier blowdown. The Dallman Ash Pond historically received fly ash and bottom ash, which were sluiced with raw lake water from the power generating structures, and industrial facility wastewater treatment plant clarifier blowdown. Settled water from both the Lakeside Ash Pond and Dallman Ash Pond flows into opposite sides of a Clarification Pond for final treatment before being discharged to Sugar Creek at NPDES permitted Outfall 004.

Groundwater adjacent to the impoundments has been monitored under the direction of the Illinois EPA Bureau of Water beginning in 2011 and the US EPA (2016) pursuant to 40 CFR §257.91 –

§257.97. A Groundwater Monitoring Program (GMP) and statistical method appropriate for evaluating groundwater quality changes was prepared, placed into the facility operating record and certifications posted to the facility website October 12, 2017. The GMP was updated April 2018 (certification posted June 7, 2018) when well AW-3 was replaced. The GMP and statistical method were again updated March 2024 (certifications posted March 11, 2024) when wells AP-14, AW-1, and G120 were added to the program. The groundwater protection standards were recalculated, and the sampling procedures document was revised based upon USEPA comments. Most recently, the GMP and statistical method were updated in February 2025 (certifications posted February 21, 2025). Groundwater monitoring performed in accordance with the GMP identified Appendix III parameters at specific wells that exceeded the background concentrations. The exceedances were evaluated pursuant to 40 CFR §257.95. Assessment monitoring results over the period of first quarter 2022 (February 16, 2022) through fourth quarter 2024 (November 11, 2024) identified Appendix IV parameter arsenic exceeding the groundwater protection standard (0.0239 mg/L) at wells RW-3, AP-7, AP-8, and AW1 and Appendix IV parameter cobalt exceeding the groundwater protection standard (0.006 mg/L) at wells AP-2 and AP-3.

A detailed description of groundwater monitoring history for the impoundments is presented in Section 3 below.

3. GROUNDWATER MONITORING PROGRAM

Currently, the surface impoundments are regulated by the USEPA (40 CFR Part 257) and the Illinois EPA (35 Ill. Adm. Code 845). There are two separate groundwater monitoring programs. Data from both regulatory programs have been used in this report and will be differentiated where applicable.

Pursuant to 35 Ill. Adm. Code 845 and 40 CFR §257.91, a GMP was prepared for the CWLP CCR surface impoundments to characterize the groundwater monitoring network of wells, the sampling and analysis methods and procedures, and the Groundwater Protection Standards (GWPS). The GMP also characterizes the activities associated with the assessment of corrective measures, corrective action plan, and implementation of the corrective action plan.

3.1 Historical Groundwater Monitoring Activities

The GMP was initially operated pursuant to §257.94 and consisted of wells AP-1R, AP-2A, AP-3, AP-4, AP-5, and RW-3/AW-3. Under §257.94, constituents listed in Appendix III to 40 CFR Part 257 were monitored on a routine basis. In accordance with §257.95(b), an Assessment Monitoring Program was implemented in February 2018 in response to the statistically significant increase (SSI) over background concentrations for one or more parameters listed in Part 257, Appendix III. In May 2019, as part of the §257.94(e)(2) alternate source investigation, wells AP-6

and AP-7 were installed. Subsequent investigation of the Statistically Significant Increases (SSIs) completed pursuant to §257.95(g)(3)(ii) demonstrated compliance with the GWPS as no Appendix IV constituent concentration exceeded the GWPS. Therefore, assessment monitoring continued pursuant to §257.95(f).

In response to exceedances of GWPS values pursuant to 35 IAC 845.600, seven more wells were installed as part of the Illinois EPA CCR program to augment the monitoring well network and allow the evaluation of exceedances. In February 2021, wells AP-10 and AP-14 were installed along the west side of the impoundments, AP-8 installed along the north side of the CCR ash impoundments and wells AP-9, AP-11, AP-12, and AP-13 were installed west of the creek as facility boundary wells.

In March 2024, six existing wells from the 35 IAC 845 program were added to the 40 CFR 257 groundwater monitoring network pursuant to correspondence with the USEPA. These wells included AP-6, AP-7, AP-8, AP-14, AW-1, and G120.

In May 2024, five additional monitoring wells were advanced in locations across Sugar Creek opposite of the CCR ash impoundments. The subject temporary assessment wells (i.e., T-1, T-2, T-4, T-5, and T-6) were installed at these locations for purposes of an alternate source demonstration and/or determination of the nature and extent of elevated concentrations per 40 CFR 257.95(g)(1)(i) and (iii). The screen intervals were set at the bedrock interface, consistent with the existing downgradient wells. The current monitor well network is shown in Figure 2. Boring logs and well completion reports for the referenced temporary assessment wells are provided in Appendix *A*.

3.2 Monitoring System

In accordance with §257.91 the groundwater monitoring system consists of a sufficient number of wells, installed at appropriate locations and depths, to yield groundwater samples from the uppermost aquifer that: (1) accurately represent the quality of background groundwater that has not been affected by the CCR surface impoundment, and (2) accurately represent the quality of groundwater passing the impoundment boundary of the CCR surface impoundment to monitor potential geochemical changes in the uppermost aquifer.

Pursuant to §257.91(b) the number, spacing, and depths of the groundwater monitoring wells have been determined based upon site-specific technical information to meet the rule's performance standard, including the subsurface conditions observed at the site. This includes a characterization of the uppermost aquifer and the confining bedrock layer immediately below the uppermost aquifer.

The groundwater monitoring system consists of wells screening the silt, sand, and gravel at the bedrock interface. Based on the direction of groundwater movement, the northern and western boundaries of the impoundments will be downgradient, and the southern boundaries will be upgradient for both impoundments with the eastern boundaries being upgradient to the Lakeside Ash Pond.

As shown in Figure 2, the current monitor well network includes AP-1R, AP-2A, AP-3, AP-4, AP-5, AP-6, AP-7, AP-8, AP-10, AP-14, RW-3, AW-1, and G120. Two (2) groundwater monitoring wells are representative of background (ambient) groundwater quality conditions of the uppermost aquifer. These wells are identified as AP-4 and AP-5. Background concentrations are chemical concentrations or parameter values that represent naturally-occurring groundwater that has not been affected by the surface impoundment or other facility activities.

Monitoring well AP-4 is located in the southwest corner of the CCR surface impoundments and along the eastern bank of Sugar Creek, immediately north of the Spaulding Dam. Well AP-4 is screened at the surface of the Pennsylvanian shale and basal sand deposits. This well is not upgradient of the subject CCR surface impoundments, but it is located on available CWLP property where it provides representative background groundwater quality pursuant to §257.91(a).

Monitoring well AP-5 is located in a hydraulically upgradient location, southeast of the Lakeside Ash Pond and in a slightly higher topographic location. The well is screened in wet sand and silt seams a few feet above the shale as the borehole samples at the bedrock interface were tight with no indications of formation water. This well monitors the upgradient groundwater quality of the uppermost aquifer at this location.

Eleven groundwater wells allow monitoring of the downgradient groundwater quality conditions in the uppermost aquifer (See Figure 2). The wells are identified as AW-1, RW-3, AP-1R, AP-2A, AP-3, AP-6, AP-7, AP-9, AP-10, AP-14, and G120. The locations and depths of these wells accurately represent the quality of groundwater passing the impoundment boundaries of the CCR units and reasonably make possible the detection of geochemical changes in the uppermost aquifer. Figure 3 identifies the facility boundary wells T-1, T-2, T-4, T-5, T-6, AP-7, AP-9, AP-11, AP-12, and AP-13 installed pursuant to 35 IAC 845.650(d)(1) and/or 40 CFR 257.95(g)(1) to delineate the GWPS exceedances. Temporary assessment wells AP-6 and AP-7 were installed during a July 2019 nature and extent investigation. Temporary assessment wells (i.e., T-1, T-2, T-4, T-5, and T-6) were installed west and north of Sugar Creek as part of the October 28, 2024 ASD to determine the nature and extent of elevated parameter concentrations. The screen intervals of these wells were set at the bedrock interface, consistent with the existing downgradient wells.

Groundwater sampling and analysis over the review period (i.e., first quarter 2022 through fourth quarter 2024) has demonstrated that the CCR surface impoundments have resulted in exceedances of the Appendix IV GWPS for arsenic at wells, AP-8, AW-1, and RW-3 and Appendix IV GWPS exceedances of cobalt at wells AP-2A and AP-3. The vertical and horizontal extent of has been delineated pursuant to §257.95(g)(1).

The detections of arsenic at monitoring well AP-7 are attributed to an alternate source and are not related to the CCR surface impoundments. AP-7 is located north of Sugar Creek, in an area hydrologically separated from the Dallman Ash Pond and other CCR units by a convergent groundwater flow system that directs groundwater from the north and south toward the creek.

Potentiometric surface elevations confirm that groundwater north of Sugar Creek flows southward toward the creek, while groundwater south of the creek, including beneath the Dallman Ash Pond, flows northward. This bidirectional flow pattern establishes Sugar Creek as a discharge zone and a natural hydraulic divide. The absence of hydraulic connectivity between the CCR impoundments and well AP-7 effectively rules out the CCR units as a source of arsenic at this location.

Furthermore, temporary assessment wells T-5 and T-6, located north of AP-7, exhibit potentiometric elevations greater than AP-7, indicating that groundwater and any associated constituents flows from those locations toward AP-7, not from the CCR units located south of the creek. These findings are corroborated by analytical results showing no consistent pattern of arsenic exceedances in wells situated between the Dallman Ash Pond and AP-7.

The spatial distribution of arsenic, combined with groundwater flow direction and the absence of a geochemical plume connecting the impoundments to AP-7, strongly supports the conclusion that the arsenic detected in AP-7 originates from natural geologic variability or other anthropogenic sources unrelated to the CCR surface impoundments. Therefore, no further action under CCR regulatory provisions is warranted at AP-7 based on current data.

3.3 Sampling and Analysis

The GMP includes consistent sampling and analysis procedures to provide accurate representation of groundwater quality (§257.93(a)). The activities include sample collection, preservation and shipment, analytical procedures, chain of custody, and quality assurance and quality control.

Groundwater is sampled for the constituents listed in Appendix III and Appendix IV to Part 257. For groundwater monitoring, these constituents include:

Appendix III to Part 257 Constituents for Detection Monitoring

- Boron
- Calcium
- Chloride
- Fluoride
- pH
- Sulfate
- Total Dissolved Solids

Appendix IV to Part 257 Constituents for Assessment Monitoring

- Antimony
- Arsenic
- Barium
- Beryllium
- Cadmium
- Chromium
- Cobalt
- Fluoride
- Lead
- Lithium
- Mercury
- Molybdenum
- Selenium
- Thallium
- Radium 226 and 228 combined

In accordance with §257.93(i), all constituents are analyzed as total recoverable metals where samples are not field filtered. All groundwater samples collected pursuant to §257 Subpart D are analyzed by a certified laboratory using Test Methods for Evaluating Solid Waste, Physical/ Chemical Methods, SW-846 (§257.93(b)). Pursuant to §257.93(c), groundwater levels are measured in each groundwater monitoring well immediately prior to purging, and each time groundwater is sampled.

All monitoring wells were sampled in accordance with 40 CFR 257.95(g)(1)(iv) for the characterization of the nature and extent.

4. SITE HYDROGEOLOGY

The uppermost aquifer and underlying confining unit control groundwater movement and the potential for CCR impacted groundwater migration. Detailed hydrogeologic information contained in the Flow Path Report was utilized to characterize the hydrogeology beneath the impoundments and Unit 2 Landfill. The Flow Path Report is provided in the final appendix of this document (Appendix J).

4.1 Uppermost Aquifer

The uppermost aquifer is characterized as the basal sand overlying the shale bedrock. In some locations, the creek fill materials, ranging from silty clays and organic silty clays to silty sands and clayey sands, were found not to be in direct hydraulic communication with the basal sand that directly overlies the bedrock surface. The Patrick report (1993) defined the creek fill material as materials placed into the abandoned creek within the Unit 2 landfill area. In further review of the historical documents, boring logs and cross sections, it was determined that the boring logs completed by Patrick incorrectly identified natural materials in the upper cohesive deposit as fill.

As indicated above, the hydraulic conductivity of the basal sand ranges from 5.6×10^{-4} to 3.6×10^{-2} cm/sec. The groundwater in the basal sand appears to be under confined, semi-confined, or unconfined conditions dependent upon location. The upper limit of the uppermost aquifer is dependent upon the seasonally fluctuating groundwater table. The potentiometric surface of the basal sand varies from 565 feet MSL at upgradient locations, south of the Lakeside Ash Pond, to 525 feet MSL at downgradient locations near Sugar Creek, north of the Dallman Ash Pond. As a result, the saturated thickness is variably dependent upon the location and the seasonal variation in the groundwater table.

Groundwater movement within the uppermost aquifer is controlled by recharge along topographic highs and discharge along topographic lows via gravity. The pre-surface impoundment flow direction in the uppermost aquifer was dominantly horizontal from the adjacent banks toward the natural convergence along Sugar Creek, which formerly drained the site. This was overall from east to west and south to north, perpendicular to Sugar Creek with local deviations. This dominant flow pattern persists under present day conditions but with localized variation introduced by the hydrologic discontinuity created upon construction of the CCR surface impoundments.

Groundwater elevations are collected on a quarterly basis from the CCR surface impoundment groundwater monitoring wells. The groundwater elevations were used to construct potentiometric surface maps based on wells screened in the basal sand (see Appendix B).

Groundwater monitoring well AW-1 exhibited exceedances of the Appendix IV parameter arsenic during the review period (first quarter 2022 through fourth quarter 2024). Well AW-1 is located

along the southeast corner of the Dallman Ash Pond. Groundwater monitoring wells/piezometer R111, G120 and P06D are located east, north and northeast of AW-1, respectively. Well R111 is part of the 40 CFR 257.94 groundwater monitoring program for the CCR landfill. Both well R111 and piezometer P06D are part of the Illinois EPA groundwater monitoring program for the FGDS Development landfill established pursuant to 35 IAC 811.319.

The potentiometric surface elevations at wells AW-1, R111, G120, and P06D are shown in the following table.

Well	2/16/22	6/2/22	8/25/22	11/9/22	1/26/23	4/11/23	7/5/23	10/25/23	2/22/24	5/13/24	8/12/24	11/12/24
AW-1	541.50	541.55	539.31	540.70	544.02	541.05	539.73	537.04	542.55	541.79	538.85	539.88
R111	529.90	529.40	528.20	528.85	526.74	527.74	526.87	525.53	528.06	528.18	526.11	527.16

NM – Not Measured

Potential constituent concentrations are expected to travel via advective flow. Groundwater, movement is west to east/northeast along the east side of the Dallman Ash Pond. The impacts reported for well AW-1 are attributed to the Dallman Ash Pond. These impacts are delineated by the downgradient wells R111, G120, and P06D. As discussed in Section 5.1 below, arsenic concentrations detected in AW-1 have been delineated.

The temporary assessment well AP-7 was installed to determine the extent of elevated concentrations of specific constituents observed at well RW-3. Sampling of AP-7 indicated exceedance of the Groundwater Protection Standard for arsenic. Additional temporary assessment wells T-5 and T-6 were installed to delineate concentrations of arsenic in the vicinity of AP-7. Temporary assessment well T-4 was installed north of Sugar Creek to delineate concentrations of arsenic detected at well AP-8.

The potentiometric surface elevations at wells RW-3, AP-6, AP-7, and AP-8 and temporary assessment wells T-4, T-5 and T-6 are shown in the following table. The surface water elevations for Sugar Creek (USGS Gage 05576250) are also included in the following table.

Well	2/16/22	6/2/22	8/25/22	11/9/22	1/26/23	4/11/23	7/5/23	10/25/23	2/22/24	5/13/24	8/12/24	11/12/24
RW-3	529.64	530.30	529.72	528.71	528.52	529.68	527.43	526.63	529.32	530.55	527.11	526.97
AP-6	530.04	530.06	528.6	NM	528.51	529.03	526.98	526.4	528.61	529.89	526.71	526.65

Note:
NM – not measured
NI – not installed

The groundwater elevations at well RW-3 are greater than those observed at AP-6, a well located between Sugar Creek and RW-3. The creek elevation is consistently lower than the groundwater elevations adjacent (both sides) to the creek. This indicates groundwater movement is from RW-3 to the north. Potentiometric surfaces in wells T-5 and T-6 are greater than well AP-7, all located north of Sugar Creek. Groundwater movement is from north to south towards the creek. The creek is a convergence point (low point) between wells screened north and south of the creek. Potential constituent concentrations will travel via advective flow. As groundwater, movement is north to south, north of the creek, no influence from the impoundments will be detected north of the creek.

Similarly, to the north end of the Dallman Ash Pond, groundwater east and west of the Dallman Ash pond converges on Sugar Creek. Groundwater monitoring wells AP-2A and AP-3 are located immediately east of Sugar Creek, at the toe of the Dallman Ash Pond embankment. Groundwater monitoring wells AP-11 and AP-12 were installed west of Sugar Creek to delineate concentrations of cobalt. These wells were installed as assessment wells to determine the extent of the impacts observed at wells AP-2A and AP-3. Groundwater monitoring well T-2 was installed further west of AP-11 and AP-12 to allow determination of groundwater flow west of Sugar Creek.

The potentiometric surface elevations at wells AP-2A, AP-3, AP-11 and AP-12 and temporary assessment well T-2 are shown in the following table. The surface water elevations for Sugar Creek (USGS Gage 05576250) are also included in the following table.

Well	2/16/22	6/2/22	8/25/22	11/9/22	1/26/23	4/11/23	7/5/23	10/25/23	2/22/24	5/13/24	8/12/24	11/12/24
AP-2A	529.89	528.17	527.23	NM	529.2	528.86	527.53	527.40	528.88	529.05	527.61	529.56
AP-3	526.98	525.54	524.39	NM	525.93	525.77	524.69	525.31	528.14	526.14	525.30	525.70
Sugar Creek	524.48	525.34	520.3	521.42	523.29	520.25	521.86	520.35	520.18	522.06	520.28	521.34

T-2	NI	NI	NI	NI	NI	NI	NI	NI	NI	530.37	523.87	534.39

Note:
NM – not measured
NI – not installed

Potential constituent concentrations are expected to travel via advective flow. Groundwater, movement is east to west along the east side of Sugar Creek and west to east along the west side of Sugar Creek. No influence from the impoundments will be detected west of the creek. As discussed in Section 5.1 below, arsenic concentrations detected in AP-7 are not the result of influences from the impoundments.

4.2 Lower Confining Unit

The uppermost bedrock at the project site is primarily Pennsylvanian age shale with isolated thin coal layers. The Pennsylvanian shale functions as a lower confining unit due to its low permeability and effective porosity. The lower confining unit represents a natural hydrogeologic barrier (i.e., aquitard) to the vertical movement of groundwater.

In situ hydraulic conductivity test (slug tests) indicate that the hydraulic conductivity for the upper portions of the bedrock range from 1.8×10^{-7} to 1.3×10^{-6} cm/sec (Patrick, 1993). There appears to be good correlation between the rock lithology and the measured values of hydraulic conductivity. The bedrock over most of the site will act as an aquitard and prevent the downward movement of groundwater. Slug tests and boring logs for the two bedrock wells (P-6R and P-7R) are included in Appendix C.

4.3 Surface Water

The nearest surface water bodies are Lake Springfield, located upgradient to the CCR surface impoundments and Sugar Creek located adjacent to the western and northern perimeter of the CCR surface impoundments:

- Lake Springfield
- Sugar Creek

4.3.1 Surface Water Intakes

There are two surface water intakes located near the CCR surface impoundments facility. These intakes are identified as:

- Intake No. 52140 - Lake Springfield 1 Intake
- Intake No. 52141 - South Fork Horse Creek Intake

Both of these intakes are located along Lake Springfield and supply water to the Springfield public water supply (IL1671200). These intakes are upgradient of the CCR surface impoundments and completely disassociated with the impoundments.

4.4 Community Water Supply Wells

A potable water well survey was completed in the vicinity of the Dallman and Lakeside Ash Ponds. The survey was conducted using the Illinois EPA's web-based Geographic Information System (GIS) database[1] in the Source Water Assessment Program (SWAP) for potable water wells downgradient of the CCR impoundments.

[1] (http://illinois-epa.maps.arcgis.com/apps/webappviewer/index.html?id=4d37a05f5ba441f1b30dab54ccb81fc8)

The Illinois EPA's SWAP GIS database system identifies community water supply wells and other potable wells (private, semi-private and non-community water supply wells) include data from the following sources:

- Illinois EPA, Division of Public Water Supplies;
- Illinois State Geological Survey (ISGS);
- Illinois State Water Survey; and
- Illinois Department of Public Health

Based on groundwater elevation data from numerous monitoring wells and piezometers located between and adjacent to the CWLP CCR impoundments, groundwater movement in the vicinity of the CCR impoundments is generally from the south-southeast to the north, approximately paralleling the Sugar Creek basin. The search extended to the first water well encountered hydraulically downgradient of the impoundments, located near Illinois Route 29 at a distance of approximately 3,400 feet.

There is no reason to believe that potable wells exist within 2,500-feet of the CCR impoundments that were not identified as part of this potable water well survey.

5. GROUNDWATER ANALYTICAL RESULTS

Quarterly groundwater sampling and analyses have occurred at CCR Impoundment wells for the parameters identified in Appendix III and Appendix IV to Part 257. The results of first quarter 2022 through fourth quarter 2024 sampling events indicate an exceedance of the GWPSs for the Appendix IV to Part 257 constituent arsenic at wells AW-1, RW-3, AP-7, and AP-8 and cobalt at wells AP-2A and AP-3. A summary table of the exceedances is provided as Table 1. Analytical summary tables are provided in Appendix D. Exceedance parameter trend graphs are provided in Appendix E. Geologic cross-sections are included as Appendix F. Laboratory analytical reports for the last four sampling events for the detection and assessment monitoring wells are provided in Appendix G.

5.1 Arsenic, Total

The groundwater protection standard for arsenic (0.0239 mg/L) exhibited confirmed exceedances at groundwater monitoring wells AW-1, RW-3, AP-7, and AP-8 during the review period (i.e., first quarter 2022 through fourth quarter 2024). Arsenic exceedances at downgradient wells RW-3 and AP-7 have been previously addressed in an October 28, 2024 ASD and are discussed in detail below. Graphs depicting arsenic concentrations at the CCR Impoundment groundwater monitoring well network are provided in Appendix E.

Arsenic occurs naturally in rock, soil, air, and plants. A report entitled, arsenic in Illinois Groundwater[2], was published in January 2002 in cooperation with the Illinois Department of Natural Resources, Illinois Department of Public Health, and Illinois Environmental Protection Agency. The report states that higher concentrations of arsenic are expected to be observed in private groundwater sources of drinking water as opposed to public water supply sources, as it is not filtered to remove natural sedimentation. A subsequent study conducted by the Illinois State Water Survey (Wilson, et al., 2004[3]) stated "arsenic is a minor constituent of some common minerals, and dissolved arsenic concentrations greater than 1 ppb are common in groundwater. In some aquifers and under certain conditions, much greater arsenic concentrations can be found, and concentrations above 10 ppb are not uncommon.

As discussed above, arsenic occurs naturally in rock, soil, air, and plants. The report, arsenic in Illinois Groundwater, states that higher concentrations of arsenic are expected to be observed in private groundwater sources. The elevated arsenic concentrations are attributed to the impact of the shallow outwash/bedrock aquifer. The uppermost bedrock is comprised of Pennsylvanian aged shale of the Spoon Formation. As noted in Panno et al. (1994)[4], redox-conditions and bedrock mineralogy control arsenic concentrations. Panno et al. (1994) identifies the reduction of adsorbed arsenate to arsenite as a possible source of the remobilization of adsorbed arsenic. Based upon the geological information collected to date, there appears to be a bedrock high oriented roughly northwest to southeast, between the northern limb located between T-4 and T-5 and extending southeast toward RW-3. The bedrock along this ridge appears to be the source of the higher total arsenic concentrations. Geologic cross-sections are provided in Appendix F. The ridge can be seen on two east-west cross sections, one immediately north of the impoundments (A-A') and one immediately north of Sugar Creek (M-M'). Cross Section K-K' is a north-south section crossing the creek between well T-5 and a previous assessment well TW3W. The change in bedrock elevation is very apparent, decreasing from approximately 527 feet MSL at previous assessment well GP3 to approximately 513 feet MSL at TW3W.

5.1.1 Well AW-1

Well AW-1 is located along the southeast corner of the Dallman Ash Pond. Nearby downgradient wells include R111 and G120. The concentrations of arsenic at well AW-1 during the review period ranged from 0.129 to 0.208 mg/L, exceeding the groundwater protection standard nine out of the twelve sampling events. The groundwater protection standard for arsenic was not exceeded at wells R111 or G120 during the review period.

---

[3] Wilson, S. D., Dunneback, B., Askren, K., and Kaiser, B., 2004, Arsenic in Illinois Groundwater: Implications for non-community public water supplies, MTAC TR04-0, Illinois State Water Survey, 40 p.

[4] Panno, S.V., et al. "Hydrochemistry of the Mahomet Bedrock Valley Aquifer, East-Central Illinois: indicators of recharge and ground-water flow." Ground Water, vol. 32, no. 4, July-Aug. 1994, pp. 591.

Geologic cross-sections I-I' and L-L' depict the geologic conditions in the vicinity of AW-1, G120, and R111 (see Appendix F). As depicted in these geologic cross-sections the groundwater monitoring wells are consistently screened across the basal sand and unconsolidated/bedrock interface. The potentiometric surface depicted on cross-sections I-I' and L-L' shows groundwater elevations at wells AW-1, G120, and R111. As depicted on the cross-section groundwater movement is from AW-1 towards G120 and towards R111. As indicated above, the groundwater protection standard for arsenic was not exceeded at wells P06D, R111 or G120 during the review period. These wells help define the downgradient extent of the arsenic detections at well AW-1.

5.1.2 Well RW-3

Well RW-3 is located at the northeast corner of the Dallman Ash Pond situated immediately north of the Dallman Ash Pond embankment and south of Sugar Creek. The concentrations of arsenic at well RW-3 during the review period ranged from 0.0831 to 0.74 mg/L, exceeding the groundwater protection standard all twelve sampling events.

The nature and extent of the arsenic exceedances at well RW-3 is defined by assessment wells AP-6, T-5, and T-6. These wells are located north of and downgradient of well RW-3.

The groundwater protection standard for arsenic was not exceeded at wells AP-6, T-4, T-5, or T-6 during the review period. The exceedances of arsenic at well AP-7 are discussed below.

Geologic cross-section N-N' depicts the geologic conditions along the north and south side of Sugar Creek, from RW-3 through AP-6, and across Sugar Creek to AP-7 (see Appendix F). As depicted in the geologic cross-sections the groundwater monitoring wells are consistently screened across the basal sand and unconsolidated/bedrock interface. The potentiometric surface depicted on cross-section N-N' shows groundwater elevations at these wells and Sugar Creek. As depicted on the cross-section groundwater movement both north and south of Sugar Creek appears to be toward the creek, as expected with a gaining stream.

5.1.3 Well AP-7

Well AP7 was installed to determine the nature and extent of the arsenic detected in well RW-3. The concentrations at well AP-7 ranged from non-detect (<0.025 mg/L) to 0.0947 mg/L during the review period, exceeding the groundwater protection standard nine out of the twelve sampling events.

Temporary assessment wells located north of AP-7 include T-5 and T-6. Only three sampling events have occurred thus far for these temporary assessment wells. Arsenic concentrations at wells T-5 and T-6 ranged from less than the detection limit (0.001 mg/L) to 0.0158 mg/L for the second and third quarters of 2024 and at 0.0016 mg/L for the fourth quarter 2024.

The creek has historically been a point of convergence for the local groundwater system. As depicted in geologic cross-section N-N', groundwater movement at well AP-7 appears to be towards the creek, which is toward the impoundments (see Appendix F). The groundwater quality at well AP-7 is believed representative of conditions north of and unrelated to the CCR site.

5.1.4 Well AP-8

Well AP-8, was installed along the north side of the Dallman Ash Pond to characterize CCR constituent concentrations. The concentrations of arsenic at well AP-8 during the review period ranged from 0.0319 to 0.0513 mg/L, exceeding the groundwater protection standard for seven out of the twelve sampling events. The nature and extent of the arsenic exceedance at well AP-8 is defined by temporary assessment well T-4. Well T-4 was installed north of well AP-8, along the northern bank of Sugar Creek. Only three sampling events have occurred thus far for temporary assessment well T-4. The concentrations of arsenic at well T-4 during the review period ranged from 0.0013 to 0.0055 mg/L.

Geologic cross-section O-O' depicts the geologic conditions along the north and south side of Sugar Creek, near AP-8 and T-4 (see Appendix F). As depicted in the geologic cross-sections the groundwater monitoring wells are consistently screened across the basal sand and unconsolidated/bedrock interface. The potentiometric surface depicted on cross-section O-O' shows groundwater elevations at wells AP-8 and T-4 and Sugar Creek. As depicted on the cross-section groundwater movement, both north and south of Sugar Creek appears to be toward the creek.

5.1.5 Piezometer P06D

Piezometer P06D was redeveloped and sampled for total arsenic the first quarter 2025, resulting in a concentration of 0.0153 mg/L. The piezometer is screened in silty sand directly overlying the bedrock surface. As stated above, arsenic concentrations exceeding the GWPS at AW-1 are delineated by P06D. The piezometer has only been recently sampled two times: second quarter 2021 (0.0269 mg/L), and the first quarter 2025 (0.0153 mg/L). The boring log, well completion report and analytical reports are provided in Appendix H.

5.1.6 Piezometer GP-7

Piezometer GP-7 is located north of the northeast corner of the Dallman Ash Pond, screened in a dark gray silty sand. The piezometer was installed in 2019 to better define the hydrogeologic characteristics in the proximity of well RW-3. The piezometer was sampled and analyzed for total arsenic and field parameters August 8, 2025. The total arsenic concentration result was 0.0072 mg/L, delineating concentrations of arsenic exceeding the GWPS at RW-3. The boring log, well completion report and laboratory report at provided in Appendix I.

5.2 Cobalt, Total

The analytical results for cobalt (0.006 mg/L) exhibit confirmed exceedances of the groundwater protection standard at groundwater monitoring wells AP-2A and AP-3 during the review period (i.e., first quarter 2022 through fourth quarter 2024).

Cobalt in Illinois groundwater is not extensively documented; however, its presence is inferred from geological and anthropogenic sources. According to Hem (1985)[5] naturally occurring concentrations of cobalt are low (<0.1 mg/L) in natural groundwater, likely derived from weathering of Cobalt-rich minerals. Elevated concentrations (>0.05 mg/L) typically indicate anthropogenic inputs. Electric Power Research Institute (EPRI) (2019)[6] states the occurrence of cobalt in CCR leachate ranges from less than the analytical detection limit to 3.1 mg/L with the median concentrations for porewater from different types of CCR at concentrations typically less than 0.004 mg/L.

Graphs depicting cobalt concentrations at the CCR impoundment groundwater monitoring well network are provided in Appendix E.

5.2.1 AP-2A

The concentrations of cobalt at well AP-2A during the review period ranged from 0.0068 to 0.0115 mg/L, exceeding the groundwater protection standard (0.006 mg/L) for all twelve sampling events. At well AP-11, located west of the creek from AP-2A, the cobalt concentrations ranged from non-detect (<0.005 mg/L) to 0.0061 mg/L, exceeding the groundwater protection standard in two of the twelve sampling events.

Well AP-2A is located along the west side of the CCR impoundments and immediately east of Sugar Creek. As part of the evaluation of the extent of cobalt concentration in excess of the GWPS, temporary assessment wells AP-11 and T-2 were installed along the west side of Sugar Creek. Only three sampling events have occurred thus far for temporary assessment well T-2. The groundwater protection standard exceedances for cobalt at well AP-11 occurred during 2022 and 2023. The maximum concentrations detected at AP-11 during this period was 0.011 mg/L. Quarterly cobalt concentrations at AP-11 have been below the detection limit of 0.005 mg/L since October 2023, delineating the GWPS exceedances at AP-2 to the west.

The creek has historically been a point of convergence for the local groundwater system. Geologic cross-sections B-B' and C-C' depict the geologic conditions along the west side and east side of Sugar Creek, respectively (see Appendix F). As depicted in the geologic cross-sections, the groundwater monitoring wells are consistently screened across the basal sand and

[5] *Hem, J. D. - Study and interpretation of the chemical characteristics of natural water. 3.ed: U.S. Geological Survey Water- Supply Paper 2254. 1985. p. 272.*

[6] *Chemical Constituents in Coal Combustion Products: cobalt. EPRI, Palo Alto, CA: 2019. 3002016497.*

unconsolidated/bedrock interface. The potentiometric surface depicted on cross-section P-P' shows groundwater elevations at wells AP-2A and AP-11 and Sugar Creek. As depicted on the cross-section, groundwater movement both east and west of Sugar Creek appears to be toward the creek. The groundwater quality at wells AP-11 and T-2 is representative of conditions west of the CCR site.

5.2.2 AP-3

The concentrations of cobalt at well AP-3 during the review period ranged from non-detect (0.005 mg/L) to 0.0071 mg/L, exceeding the groundwater protection standard in only two of the twelve sampling events. Well AP-3 is located along the west side of the CCR impoundments and immediately east of Sugar Creek. As part of the evaluation of the extent of cobalt concentration in excess of the GWPS, temporary assessment wells AP-12 and T-2 were installed along the west side of Sugar Creek. Well AP-12 is located directly west and across the creek from AP-3. Concentrations ranged from non-detect (<0.005 mg/L) to 0.0236 mg/L, exceeding the groundwater protection standard in five of the twelve sampling events. Therefore, well T-2 was installed west of AP-12 to further evaluate the cobalt concentrations. Of the three sampling events conducted at T-2 during the review period, the May 2024 sampling event yielded a concentration of 0.0075 mg/L. Subsequent quarterly sampling events at T-2 yielded concentrations below the detection limit of 0.005 mg/L, thus delineating the extent of cobalt west of AP-3.

The creek has historically been a point of convergence for the local groundwater system. Geologic cross-sections B-B', C-C', and F-F' depict the geologic conditions in the vicinity of AP-3, AP-12, and T-2 (see Appendix F). As depicted in these geologic cross-sections the groundwater monitoring wells are consistently screened across the basal sand and unconsolidated/bedrock interface. The potentiometric surface depicted on cross-section F-F' shows groundwater elevations at wells AP-3, AP-12, T-2, and Sugar Creek. As depicted on the cross-section groundwater movement both east and west of the creek appears to be toward the creek. The groundwater quality at wells AP-12 and T-2 is believed to be representative of conditions west of the CCR site.

5.3 Indicator Parameters

Detecting groundwater impacts from fly ash and bottom ash requires monitoring specific indicator parameters that reflect the leaching of CCRs and their interaction with groundwater. The best indicators are those that are mobile, persistent, and uniquely associated with CCRs, while also being detectable at low concentrations.

Based on a significant amount of data obtained from the numerous wells located on the periphery of the impoundments, boron has shown to be the best indicator parameter of the CCR constituents for the CWLP CCR ash impoundments. A graph illustrating the boron concentrations for the wells located immediately adjacent and downgradient to the impoundments (AP-1R, AP-3,

AP-4, AP-6, AP-8, AP-10, AP-14, and RW-3) is provided in Appendix E. As shown, wells AP-1R and AP-14 consistently exhibit the highest boron concentrations of the wells. Well AP-3 exhibits the next highest boron concentrations. The northern wells (AP-6 and RW-3) exhibit boron concentrations less than 0.5 mg/L. This indicates that the uppermost aquifer is not significantly influenced by the CCR impoundments on the northern periphery of the impoundments.

6. NATURE AND ESTIMATED QUANTITY OF MATERIAL

40 CFR 257.95(g)(1)(ii) requires data on the nature and estimated quantity of material released, including specific information on the constituents listed in Appendix IV and the levels at which they are present in the material released to be collected.

Information on the constituents listed in Appendix IV and the levels at which they are present in the in-place materials within Lakeside and Dallman Ash Ponds has been collected. In May 2024, four borings were advanced within Lakeside Ash Pond (L1, L3, L4, and L5) and four borings were advanced within Dallman Ash Pond (D1, D2, D3, and D4) for the purpose of obtaining representative samples of in-place solids materials and porewater. Each boring was advanced with hollow stem augers and solids samples were collected via split barrel samplers. Solids samples were submitted for total and TCLP/SPLP analysis of the Appendix IV constituents. Once final depth was reached, a PVC monitoring well was installed in the boring using 10-foot prepacked screens placed immediately above the clay bottom of the impoundments. After development, porewater samples were collected from each monitoring well and submitted for total and dissolved phase analysis of the Appendix IV constituents (see Appendix G). This information along with the volume, porosity and bulk density estimates were used to approximate the quantity of material.

The Dallman Ash Pond has approximately 1,523,073 cubic yards (1,164,000 m^3) and Lakeside Ash Pond has approximately 841,200 cubic yards (643,144 m^3) of in place CCR, a mixture of fly ash and bottom ash. The sluicing process homogenizes particle distribution and the post-settlement stratification, and consolidation decreases the CCR mixture porosity and increases the bulk density.

Studies of sluiced CCR in surface impoundments, which represent mixtures of fly ash and bottom ash, indicate that these materials exhibit porosities generally between 0.47 and 0.65 and dry unit weights ranging from 10.8 to 17.0 kN/m^3. Converting these dry unit weights to bulk densities yields values between approximately 1,100 kg/m^3 and 1,730 kg/m^3. Field data obtained by Tan et al. (2022)[7] from twelve undisturbed impoundment samples show individual sample porosities (θ) from 0.44 to 0.65 and corresponding dry unit weights (γ_n) of 10.8–17.0 kN/m^3, reflecting normally consolidated, sandy-silt-like behavior in situ.

[7] *Tan, Y., Basantis, A., Benson, C. H., & Chen, J. N. (2022). "Hydraulic Properties of Sluiced Coal Combustion Products Disposed in Impoundments." Geo-Congress 2022, 335, 505–517.*

These values are supported by laboratory-simulated impoundment tests (EPRI 2012)[8] reporting bulk densities near 1,000–1,200 kg/m³. For context, individual ash properties reported by IEA Clean Coal Centre (2008)[9] show porosity ranges of 0.40–0.50 for fly ash and 0.25–0.40 for bottom ash, but mixed, sluiced CCR exhibits somewhat higher porosities due to fines content and natural consolidation.

Based on regression analyses presented by Tan et al. (2022), "typical" impoundment-scale hydraulic properties correspond to:

- Typical Porosity: $\theta \approx 0.50$ (50 %), and
- Typical Dry Unit Weight: $\gamma_n \approx 12$ kN/m³ (≈ 1,224 kg/m³)

These values are most representative of impoundment CCRs for when site-specific data are unavailable. In the calculations below, the dry unit weight is assumed to represent the bulk density.

6.1 Antimony

The mass of antimony leachable from fly ash and bottom ash in a CCR surface impoundment was estimated from the SPLP and porewater analytical results.

Dallman Ash Pond - SPLP/TCLP Results – Antimony

Method	Units	D1 19.5-21.5	D1 36.5-38.5	D2 19.5-21.5	D2 33.5-35.5	D3 4.5-6.5	D3 14.5-29.5	D4 19.5-21.5	D4 29.5-31.5	Min	Max	Avg
SPLP	mg/L	0.0035	0.0078	0.0141	0.0273	0.0029	0.007	0.0034	0.024	0.0029	0.0273	0.0113
TCLP	mg/L	0.017	0.0237	0.0163	0.0125	0.0178	0.0197	0.0395	0.0376	0.0125	0.0395	0.0230

The porewater volume of the surface impoundment is:

$$V_{porewater} = \text{Total Impoundment Volume} \times \theta$$

$$= 1{,}164{,}000\ m^3 \times 0.50 = 582{,}000\ m^3 = 582{,}000{,}000\ L$$

Using an average concentration (0.0113 mg/L) the total mass of antimony is:

$$\text{Mass of Antimony} = \text{Average Antimony Concentration} \times V_{porewater}$$

$$= 0.0113\ mg/L \times 582{,}000{,}000\ L = 6.58\ kg$$

[8] *Electric Power Research Institute (EPRI). (2012). "Laboratory-Simulated Coal Combustion Product (CCP) Impoundment Tests."*

[9] *IEA Clean Coal Centre. (2008). Management of Coal Combustion Wastes (CCC/231).*

Conservative estimate using the maximum concentration (0.0273 mg/L) is:

= 0.0273 mg/L x 582,000,000 L = 15.9 kg

Using bulk density ($\rho_b = \frac{mass\ of\ ash}{total\ volume}$) the total ash mass in the surface impoundment is:

$M_{ash} = V_{surface\ impoundment} \times \rho_b$

= 1,164,000 m^3 x 1,224 kg/m^3 = 1,424,736,000 kg = 1.42 million metric tons

The average and maximum antimony leaching rate per metric ton of ash is:

Antimony Leached = Total Antimony Mass / Total Ash Mass

= 6.58 kg / 1,424,736 metric tons = 0.00462 g Antimony/metric ton ash

= 15.9 kg / 1,424,736 metric tons = 0.0112 g Antimony/metric ton ash

Dallman Ash Pond - Porewater Results – Antimony, total and dissolved

Method	Units	Date	D1	D2	D3	D4	Min	Max	Avg
Total	mg/L	4/29/24	J 0.061	J 0.024	0.23	0.0812	0.024	0.23	0.09905
Dissolved	mg/L	7/19/24	0.0025	0.0044	0.0034	0.0021	0.0021	0.0044	0.0031
Total	mg/L	7/19/24	0.0026	0.0058	0.0047	0.0059	0.0026	0.0059	0.00475

Note:
J - Analyte detected below quantitation limits

Using average porewater data for antimony, dissolved, the total mass is:

Mass of Antimony = Average Antimony Concentration x $V_{porewater}$

= 0.0031 mg/L x 582,000,000 L = 1.8 kg

Conservative estimate using the maximum concentration (0.0059 mg/L) is:

= 0.0044 mg/L x 582,000,000 L = 2.56 kg

The average and maximum antimony leaching rate per metric ton of ash is:

= 1.8 kg / 1,424,736 metric tons = 0.00127 g Antimony/metric ton ash

= 2.56 kg / 1,424,736 metric tons = 0.00180 g Antimony/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Antimony

Parameter	SPLP	Porewater
Average Antimony Concentration	0.0113 mg/L	0.0031 mg/L
Total Antimony Mass	6.58 kg	1.80 kg

The concentrations of antimony, dissolved, in the porewater sample are approximately 73% lower compared to SPLP results (0.0031mg/L vs. 0.0113 mg/L). The total antimony mass in porewater is 1.8-2.56 kg, significantly lower than SPLP-derived estimates (6.58-15.9 kg).

The significant difference between SPLP-derived antimony estimates (6.58-15.9 kg) and actual porewater measurements (1.8-2.56 kg) stems from fundamental contrasts between laboratory leaching tests and in-situ geochemical conditions. The SPLP test's acidic environment (pH 4.2) aggressively mobilizes antimony by dissolving weakly bound fractions and oxidizing Sb(III) to highly soluble Sb(V) (antimonate). This creates a "worst-case" leaching scenario that overestimates field conditions.

In contrast, the alkaline, reducing environment within the ash pond (pH ~8-12) promotes antimony retention through two key mechanisms: First, reducing conditions stabilize antimony as Sb(III) (antimonite), which strongly adsorbs to abundant iron oxide surfaces in the ash. Second, the high pH enhances Sb(III) adsorption onto mineral phases while simultaneously limiting mineral dissolution. These processes collectively suppress antimony solubility in the actual porewater, resulting in 73% lower dissolved concentrations than SPLP predictions.

Regarding mobility, antimony's behavior under current pond conditions is relatively constrained. The dominant Sb(III) species exhibits low mobility due to its affinity for iron oxides and the advection-dominated flow regime. However, this could change if environmental conditions shift: Oxidation during pond decommissioning could convert Sb(III) to mobile Sb(V), while acidic groundwater intrusion could dissolve sorbed fractions. The primary transport risk remains advective movement of Sb(V) rather than diffusion, given the low concentration gradients observed. Monitoring redox transitions and maintaining alkaline conditions are thus critical for long-term management.

Lakeside Ash Pond - SPLP/TCLP Results – Antimony

Method	Units	L1 14.5-21.5	L1 24.5-31.5	L3 19.5-21.5	L3 29.5-32.7	L4 10-15.3	L5 19.5-21.5	L5 32.5-35.2	Min	Max	Avg
SPLP	mg/L	0.0114	0.0012	0.0054	0.0037	J 0.0009	0.0067	0.0025	0.0009	0.0114	0.0045
TCLP	mg/L	0.0019	0.0064	0.0066	0.0024	0.0012	0.0072	0.0017	0.0012	0.0072	0.0039

The porewater volume of the surface impoundment is:

= 643,144 m^3 x 0.50 = 351,572 m^3 = 351,572,000 L

Using an average concentration (0.0045 mg/L) the total mass of antimony is:

= 0.0045 mg/L x 351,572,000 L = 1.58 kg

Conservative estimate using the maximum concentration (0.0114 mg/L) is:

= 0.0114 mg/L x 351,572,000 L = 4.01 kg

Using bulk density, the total ash mass in the surface impoundment is:

= 351,572 m^3 x 1,224 kg/m^3 = 430,324,128 kg = 0.430 million metric tons

The average and maximum antimony leaching rate per metric ton of ash is:

= 1.58 kg / 430,324 metric tons = 0.00367 g Antimony/metric ton ash

= 4.01 kg / 430,324 metric tons = 0.00932 g Antimony/metric ton ash

Lakeside Ash Pond - Porewater Results – Antimony, total and dissolved

Method	Units	Date	L1	L3	L4	L5	Min	Max	Avg
Total	mg/L	4/29/24	BJ 0.027	B 0.0655	0.002	<B 0.1	0.002	0.1	0.0486

Total	mg/L	7/19/24	0.0011	J 0.0008	0.0051	J 0.0009	0.0008	0.0051	0.00198

Note:
B - Analyte detected in associated Method Blank
J - Analyte detected below quantitation limits

Using average porewater data for antimony, dissolved, the total mass is:

= 0.00148 mg/L x 351,572,000 L = 0.520 kg

Conservative estimate using the maximum concentration (0.0025 mg/L) is:

= 0.0025 mg/L x 351,572,000 L = 0.879 kg

The average and maximum antimony leaching rate per metric ton of ash is:

= 0.520 kg / 430,324 metric tons = 0.00121 g Antimony/metric ton ash

= 0.879 kg / 430,324 metric tons = 0.00204 g Antimony/metric ton ash

Comparison of the average porewater result with the average SPLP estimate:

Lakeside Ash Pond - Results Comparison – Antimony

Parameter	SPLP	Porewater
Average Antimony Concentration	0.0045 mg/L	0.00148 mg/L
Total Antimony Mass	1.58 kg	0.520 kg

The concentrations of antimony, dissolved, in the porewater sample are approximately 67% lower compared to SPLP results (0.00148 mg/L vs. 0.0045 mg/L). The total antimony mass in porewater is 0.52-0.879 kg, significantly lower than SPLP-derived estimates (1.58-4.01 kg).

Similar to the Dallman Ash Pond, the significant differences between SPLP-derived and porewater antimony concentrations in Lakeside Ash Pond reflect fundamental distinctions between leaching potential (SPLP) and in-situ equilibrium (porewater), controlled by site-specific geochemistry. See discussion above.

6.2 Arsenic

The mass of arsenic leachable from fly ash and bottom ash in a CCR surface impoundment was estimated from the SPLP and porewater analytical results.

Dallman Ash Pond - SPLP/TCLP Results – Arsenic

Method	Units	D1 19.5-21.5	D1 36.5-38.5	D2 19.5-21.5	D2 33.5-35.5	D3 4.5-6.5	D3 14.5-29.5	D4 19.5-21.5	D4 29.5-31.5	Min	Max	Avg

The porewater volume of the surface impoundment is 582,000,000 L. Using an average concentration (0.0194 mg/L) the total mass of arsenic is:

= 0.0194 mg/L x 582,000,000 L = 11.3 kg

Conservative estimate using the maximum concentration (0.0471 mg/L) is:

= 0.0471 mg/L x 582,000,000 L = 27.4 kg

Based upon a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum arsenic leaching rate per metric ton of ash is:

= 11.3 kg / 1,424,736 metric tons = 0.00793 g Arsenic/metric ton ash

= 27.4 kg / 1,424,736 metric tons = 0.0192 g Arsenic/metric ton ash

Dallman Ash Pond - Porewater Results – Arsenic, total and dissolved

Method	Units	Date	D1	D2	D3	D4	Min	Max	Avg
Total	mg/L	4/29/24	1.17	0.279	2.33	0.378	0.279	2.33	1.04
Dissolved	mg/L	7/19/24	0.0829	0.111	0.0797	0.0231	0.0231	0.111	0.0742
Total	mg/L	7/19/24	0.171	0.16	0.104	0.0629	0.0629	0.171	0.124

Using average porewater data for arsenic, dissolved, the total mass is:

= 0.124 mg/L x 582,000,000 L = 43.2 kg

Conservative estimate using the maximum concentrations (0.171 mg/L) is:

= 0.171 mg/L x 582,000,000 L = 64.6 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum arsenic leaching rate per metric ton of ash is:

= 43.2 kg / 1,424,736 metric tons = 0.0303 g Arsenic/metric ton ash

= 64.6 kg / 1,424,736 metric tons = 0.0453 g Arsenic/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Arsenic

Parameter	SPLP	Porewater
Average Arsenic Concentration	0.0194 mg/L	0.0742 mg/L
Total Arsenic Mass	11.3 kg	43.2 kg

The concentrations of arsenic in the SPLP sample are approximately 74% lower compared to porewater results (0.0194 mg/L vs. 0.0742mg/L). The total arsenic mass in porewater is 43.2-64.6 kg, significantly higher than SPLP-derived estimates (11.3-27.4 kg). This reversal of the typical pattern (where SPLP often over predicts leaching) occurs due to arsenic's unique geochemical behavior under alkaline, reducing conditions within the ash pond.

Arsenic may be more mobile under oxidizing and alkaline conditions (common in porewater) but less mobile under acidic SPLP conditions. The higher arsenic concentrations in porewater suggest site conditions (i.e., high pH or reducing conditions) favor arsenic mobility, which SPLP does not characterize well.

Under alkaline oxidizing conditions typical of CCR porewater, arsenic is present primarily as arsenate (AsO_4^{3-}), a negatively charged oxyanion. Arsenate is poorly sorbed under high pH conditions, especially when competing anions (e.g., phosphate, sulfate) are present, allowing it to remain dissolved and mobile.

The observed difference in arsenic concentrations between porewater and SPLP leachate can be attributed to key differences in geochemical conditions, test methodology, and material interaction timeframes.

Field conditions in saturated ash impoundments often become anaerobic (reducing conditions) over time. Under reducing conditions, arsenic associated with iron oxides released into solution as ferric iron (Fe^{3+}) is reduced to ferrous iron (Fe^{2+}), dissolving iron hydroxide minerals and mobilizing arsenic, particularly arsenite (As^{3+}). SPLP, in contrast, is an aerobic laboratory procedure and does not simulate this reductive dissolution process.

Porewater in CCR surface impoundments commonly exhibits elevated pH (>8) (i.e., alkaline conditions), due to the presence of alkaline ash components. At higher pH, arsenate (As^{5+}) sorption to mineral surfaces (e.g., iron oxides or aluminosilicates) is reduced, increasing arsenic mobility. SPLP extraction fluid is mildly acidic (pH 4.2–4.8), favoring stronger sorption of arsenic and thus lower leachate concentrations.

Porewater represents long-term equilibrium conditions that allow for extended interaction between the ash and pore fluids. Over time, arsenic may desorb from solid phases or be released from the dissolution of arsenic-bearing minerals. SPLP is a short-duration test (18 hours) that does not fully capture these long-term processes.

The SPLP procedure uses a 20:1 liquid-to-solid ratio, which dilutes the leachate and may underestimate field concentrations. In contrast, porewater samples are collected under in-situ moisture conditions, often resulting in higher solute concentrations.

Porewater may contain competing anions such as phosphate, bicarbonate, or silicate, which can displace arsenic from mineral sorption sites. These constituents are typically absent or at low concentrations in SPLP extraction fluid, further limiting their ability to replicate in-situ arsenic mobility.

The higher arsenic concentration observed in porewater relative to SPLP leachate is consistent with the expected influence of site-specific geochemical conditions, including reducing redox states, alkaline pH, extended interaction time, and the presence of competing ions. These factors enhance arsenic mobility under field conditions and are not fully replicated by the SPLP test method.

Regarding mobility, arsenic's behavior is highly sensitive to two site conditions. The mobility peaks in alkaline environments (current pond conditions) and reducing conditions maintain mobile As-III. These factors currently promote arsenic mobility within the impoundment. However, advection remains the dominant transport mechanism given the low concentration gradients.

Lakeside Ash Pond - SPLP/TCLP Results – Arsenic

Total	mg/L	7/19/24	0.0139	0.0328	0.453	0.0473	0.0139	0.453	0.137

Using average porewater data for arsenic, dissolved, the total mass is:

= 0.0571 mg/L x 351,572,000 L = 20.1 kg

Conservative estimate using the maximum concentration (0.185 mg/L) is:

= 0.185 mg/L x 351,572,000 L = 65.0 kg

Based upon the total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the average and maximum arsenic leaching rate per metric ton of ash is:

= 20.1 kg / 430,324 metric tons = 0.0467 g Arsenic/metric ton ash

= 65.0 kg / 430,324 metric tons = 0.151 g Arsenic/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Lakeside Ash Pond - Results Comparison – Arsenic

Parameter	SPLP	Porewater
Average Arsenic Concentration	0.0172 mg/L	0.0571 mg/L
Total Arsenic Mass	6.05 kg	20.1 kg

The concentrations of arsenic in the SPLP sample are approximately 70% lower compared to porewater results (0.0172 mg/L vs. 0.0571 mg/L). The total arsenic mass in porewater is 20.1-65.0 kg, significantly higher than SPLP-derived estimates (6.05-11.6 kg). These results are similar to the Dallman Ash Pond SPLP and porewater analytical results. See discussion above.

6.3 Barium

The mass of barium leachable from fly ash and bottom ash in a CCR surface impoundment was estimated from the SPLP and porewater analytical results.

Dallman Ash Pond - SPLP/TCLP Results – Barium

Method	Units	D1 19.5-21.5	D1 36.5-38.5	D2 19.5-21.5	D2 33.5-35.5	D3 4.5-6.5	D3 14.5-29.5	D4 19.5-21.5	D4 29.5-31.5	Min	Max	Avg

Total	mg/L	7/19/24	0.118	0.0997	0.0823	0.186	0.0823	0.186	0.122

Using average porewater data for barium, dissolved, the total mass is:

= 0.0609 mg/L x 582,000,000 L = 35.4 kg

Conservative estimate using the maximum concentrations (0.0843mg/L) is:

= 0.0843 mg/L x 582,000,000 L = 49.1 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum barium leaching rate per metric ton of ash is:

= 35.4 kg / 1,424,736 metric tons = 0.0249 g Barium/metric ton ash

= 49.1 kg / 1,424,736 metric tons = 0.0344 g Barium/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Barium

Parameter	SPLP	Porewater
Average Barium Concentration	0.042 mg/L	0.0609 mg/L
Total Barium Mass	24.4 kg	35.4 kg

The concentrations of barium in the SPLP sample are approximately 31% lower compared to porewater results (0.042 mg/L vs. 0.0609 mg/L). The total barium mass in porewater is 35.4-49.1 kg, significantly higher than SPLP-derived estimates (24.4-26.2 kg).

The higher barium concentrations in Dallman Ash Pond's porewater compared to SPLP results arise from geochemical interactions specific to alkaline CCR environments and methodological limitations of leaching tests. Three factors drive this discrepancy.

The SPLP's acidic leachant (pH 4.2 ± 0.5) contains elevated sulfate (SO_4^{2-}) from simulated rainwater. This promotes barite ($BaSO_4$) precipitation, sequestering dissolved barium during testing—a process absent in the sulfate-limited, alkaline porewater (pH 8–12).

Natural bicarbonate (HCO_3^-) in the pond porewater complexes Ba^{2+}, increasing solubility. In contrast, SPLP's low-pH environment lacks sufficient alkalinity to offset barite formation.

High calcium (Ca^{2+}) and magnesium (Mg^{2+}) in CCR porewater compete with Ba^{2+} for sorption sites, further elevating dissolved concentrations unaccounted for in SPLP's simplified chemistry.

Barium mobility is primarily controlled by sulfate availability and pH. In the ash pond's low-sulfate, alkaline setting, barium remains relatively mobile as dissolved Ba^{2+} or bicarbonate complexes. However, its migration downgradient may self-limit if sulfate-rich groundwater is encountered, triggering barite precipitation. Advection governs transport given the pond's sandy-silt hydrology, but the risk of barium spreading is constrained by its strong affinity for sulfate unlike more mobile CCR constituents (e.g., boron).

The porewater's 35.4–49.1 kg Ba mass (vs. SPLP's 24.4–26.2 kg) confirms SPLP under predicts barium solubility in alkaline impoundments. Site-specific porewater data better reflects actual leaching risk, though long-term stability depends on preventing sulfate influx or acidic shifts that could immobilize or remobilize barium, respectively.

Lakeside Ash Pond - SPLP/TCLP Results – Barium

Method	Units	L1 14.5-21.5	L1 24.5-31.5	L3 19.5-21.5	L3 29.5-32.7	L4 10-15.3	L5 19.5-21.5	L5 32.5-35.2	Min	Max	Avg

Note:
J - Analyte detected below quantitation limits

The porewater volume of the surface impoundment is 351,572,000 L. Using an average concentration (0.0352 mg/L) the total mass of barium is:

= 0.0352 mg/L x 351,572,000 L = 12.4 kg

Conservative estimate using the maximum concentration (0.0331 mg/L) is:

= 0.0596 mg/L x 351,572,000 L = 21.0 kg

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the average and maximum barium leaching rate per metric ton of ash is:

= 12.4 kg / 430,324 metric tons = 0.0288 g Barium/metric ton ash

= 21.0 kg / 430,324 metric tons = 0.0488 g Barium/metric ton ash

Lakeside Ash Pond - Porewater Results – Barium, total and dissolved

Method	Units	Date	L1	L3	L4	L5	Min	Max	Avg
Total	mg/L	4/29/24	3.48	1.49	0.308	1.6	0.308	3.48	1.72
Dissolved	mg/L	7/19/24	0.13	0.0912	0.101	0.0523	0.0523	0.13	0.0936
Total	mg/L	7/19/24	0.161	0.128	0.497	0.0877	0.0877	0.497	0.218

Using average porewater data for barium, dissolved, the total mass is:

= 0.0936 mg/L x 351,572,000 L = 32.9 kg

Conservative estimate using the maximum concentration (0.13 mg/L) is:

= 0.13 mg/L x 351,572,000 L = 45.7 kg

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the average and maximum barium leaching rate per metric ton of ash is:

= 32.9 kg / 430,324 metric tons = 0.0765 g Barium/metric ton ash

= 45.7 kg / 430,324 metric tons = 0.106 g Barium/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Lakeside Ash Pond - Results Comparison – Barium

Parameter	SPLP	Porewater
Average Barium Concentration	0.0352 mg/L	0.0936 mg/L
Total Barium Mass	12.4 kg	32.9 kg

The concentrations of barium in the SPLP sample are approximately 62% lower compared to porewater results (0.0352 mg/L vs. 0.0936 mg/L). The total barium mass in porewater is 32.9-45.7 kg, significantly higher than SPLP-derived estimates (12.4-21 kg). These results are similar to the Dallman Ash Pond SPLP and porewater analytical results. See discussion above.

6.4 Beryllium

The mass of beryllium leachable from fly ash and bottom ash in a CCR surface impoundment was estimated from the SPLP and porewater analytical results.

Dallman Ash Pond - SPLP/TCLP Results – Beryllium

Method	Units	D1 19.5-21.5	D1 36.5-38.5	D2 19.5-21.5	D2 33.5-35.5	D3 4.5-6.5	D3 14.5-29.5	D4 19.5-21.5	D4 29.5-31.5	Min	Max	Avg

Note:
J - Analyte detected below quantitation limits

The porewater volume of the surface impoundment is 582,000,000 L. Using an average concentration (0.0009 mg/L) the total mass of beryllium is:

= 0.0009 mg/L x 582,000,000 L = 0.524 kg

Conservative estimate using the maximum concentration (0.001 mg/L) is:

= 0.001 mg/L x 582,000,000 L = 0.582 kg

Based upon a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum beryllium leaching rate per metric ton of ash is:

= 0.524 kg / 1,424,736 metric tons = 0.000368 g Beryllium/metric ton ash

= 0.582 kg / 1,424,736 metric tons = 0.000409 g Beryllium/metric ton ash

Dallman Ash Pond - Porewater Results – Beryllium, total and dissolved

Method	Units	Date	D1	D2	D3	D4	Min	Max	Avg
Total	mg/L	4/29/24	0.254	0.064	0.439	0.0674	0.064	0.439	0.206
Dissolved	mg/L	7/19/24	< 0.0005	< 0.0005	< 0.0005	< 0.0005	0.0005	0.0005	0.0005
Total	mg/L	7/19/24	0.002	0.0035	0.001	0.0056	0.001	0.0056	0.00303

The dissolved boron concentrations were reported as non-detect (<0.0005 mg/L) for all sampling events. Using the dissolved beryllium non-detect value, the total mass is:

= 0.0005 mg/L x 582,000,000 L = 0.291 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum beryllium leaching rate per metric ton of ash is:

= 0.291 kg / 1,424,736 metric tons = 0.000204 g Beryllium/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Beryllium

Parameter	SPLP	Porewater
Average Beryllium Concentration	0.0009 mg/L	0.0005 mg/L
Total Beryllium Mass	0.524 kg	0.291 kg

The concentrations of beryllium in the porewater sample are approximately 44% lower compared to SPLP results (0.0005 mg/L vs 0.0009 mg/L). The total beryllium mass in SPLP-derived estimates (0.524-0.582 kg) is higher than determined for porewater (0.291 kg).

The slightly higher SPLP-derived mass (0.524 kg vs. 0.291 kg) stems from its aggressive extraction of weakly adsorbed beryllium (Be) fractions, but the absolute difference remains small (<0.3 kg total). Both methods confirm beryllium poses minimal groundwater risk due to its extreme attenuation, consistent with its rarity as a contaminant of concern at CCR sites.

The minimal Be concentrations in both Dallman Ash Pond porewater and SPLP leachate reflect its strong geochemical immobilization, though subtle differences arise from testing conditions. Three factors explain the near-identical mass estimates.

Beryllium exhibits lowest solubility near pH 6–8. The ash pond's alkaline porewater (pH 8–12) promotes hydrolysis to insoluble $Be(OH)_2$ or $Be(OH)_3^-$, while SPLP's acidic environment (pH 4.2) slightly enhances dissolution via Be^{2+} formation, though still limited by adsorption.

Be sorbs strongly to Al/Fe/Mn oxides, clay minerals, and organic matter in ash. At high pH, it forms stable surface complexes (e.g., ≡FeO–$BeOH^+$), reducing dissolved concentrations. SPLP's low pH partially disrupts this, explaining its marginally higher detection limit but still negligible release.

Be likely exists as refractory mineral phases (e.g., bertrandite) or substituted in silicate matrices, resisting dissolution in both natural and acidic conditions.

Beryllium is inherently immobile in CCR environments due to adsorption affinity (high K_d > 10³ L/kg), low solubility in alkaline systems, and limited redox sensitivity. Its migration is restricted to short distances via advection, with precipitation or adsorption likely trapping it near source zones. No significant plume formation is expected.

The porewater volume of the surface impoundment is 582,000,000 L. Using an average concentration (0.002 mg/L) the total mass of cadmium is:

= 0.002 mg/L x 582,000,000 L = 1.16 kg

Based upon a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average cadmium leaching rate per metric ton of ash is:

= 1.16 kg / 1,424,736 metric tons = 0.000814 g Cadmium/metric ton ash

Dallman Ash Pond - Porewater Results – Cadmium, total and dissolved

Method	Units	Date	D1	D2	D3	D4	Min	Max	Avg
Total	**mg/L**	4/29/24	0.222	0.0541	0.492	J 0.068	0.0541	0.492	0.209
Dissolved	**mg/L**	7/19/24	< 0.002	< 0.002	< 0.002	< 0.002	0.002	0.002	0.002
Total	**mg/L**	7/19/24	J 0.0016	J 0.0014	< 0.002	0.0035	0.0014	0.0035	0.00213

Note:
J - Analyte detected below quantitation limits

Cadmium concentrations were non-detect (<0.002 mg/L) for all samples. Using detection limit value (0.002 mg/L) the total mass of cadmium is:

= 0.002 mg/L x 582,000,000 L = 1.16 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum cadmium leaching rate per metric ton of ash is:

= 1.16 kg / 1,424,736 metric tons = 0.000817 g Cadmium/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Cadmium

Parameter	SPLP	Porewater
Average Cadmium Concentration	0.002 mg/L	0.002 mg/L
Total Cadmium Mass	1.16 kg	1.16 kg

The concentrations of cadmium in the SPLP sample are in agreement with porewater results (0.002 mg/L vs. 0.002 mg/L). The total cadmium mass in porewater is 1.16 kg the same as the SPLP-derived estimate (1.16 kg).

The agreement between SPLP and porewater cadmium results in Dallman Ash Pond—both below detection (<0.002 mg/L) with identical mass estimates stems from cadmium's geochemical behavior in coal ash systems. Cadmium solubility is primarily controlled by pH-dependent adsorption and precipitation. In SPLP's acidic environment (pH 4.2), cadmium might be expected to mobilize as Cd^{2+}, but its strong affinity for iron oxides, clay minerals, and organic matter in ash promotes retention. Conversely, the alkaline porewater (pH 8–12) favors cadmium precipitation as insoluble carbonates (e.g., $CdCO_3$) or hydroxides, while also enhancing adsorption onto mineral surfaces. These opposing mechanisms, low-pH adsorption versus high-pH precipitation, converge to limit solubility across both environments.

Cadmium mobility is further suppressed by its tendency to form stable complexes with sulfides (e.g., CdS) under reducing conditions, which likely exist in submerged ash. The low concentrations indicate minimal dissolved cadmium, reflecting effective attenuation regardless of testing conditions. In groundwater, cadmium's mobility would be constrained by three key factors: (1) pH extremes that trigger precipitation/adsorption, (2) the presence of sorbents (Fe/Al oxides, carbonates), and (3) sulfide availability that immobilizes it as insoluble precipitates. This results in limited transport potential, confining cadmium plumes to narrow zones near sources unless acidic or low-sulfide conditions prevail. The consistency between SPLP and porewater data confirms cadmium's low leaching risk in this setting.

Lakeside Ash Pond - SPLP/TCLP Results – Cadmium

Note:
J - Analyte detected below quantitation limits

The porewater volume of the surface impoundment is 582,000,000 L. Using an average concentration (0.00936 mg/L) the total mass of chromium is:

= 0.00936 mg/L x 582,000,000 L = 5.45 kg

Conservative estimate using the maximum concentration (0.01 mg/L) is:

= 0.01 mg/L x 582,000,000 L = 5.82 kg

Based upon a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum chromium leaching rate per metric ton of ash is:

= 5.45 kg / 1,424,736 metric tons = 0.00383 g Chromium/metric ton ash

= 5.82 kg / 1,424,736 metric tons = 0.00408 g Chromium/metric ton ash

Dallman Ash Pond - Porewater Results – Chromium, total and dissolved

Method	Units	Date	D1	D2	D3	D4	Min	Max	Avg
Total	mg/L	4/29/24	3.91	0.902	6.25	1.03	0.902	6.25	3.02
Dissolved	mg/L	7/19/24	< 0.005	< 0.005	< 0.005	< 0.005	0.005	0.005	0.005
Total	mg/L	7/19/24	0.0277	0.0426	0.0121	0.0645	0.0121	0.0645	0.0367

Chromium concentrations were non-detect (<0.005 mg/L) for all samples. Using detection limit value (0.005 mg/L) the total mass of chromium is:

= 0.005 mg/L x 582,000,000 L = 2.91 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum chromium leaching rate per metric ton of ash is:

= 2.91 kg / 1,424,736 metric tons = 0.00204 g Chromium/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Chromium

Parameter	SPLP	Porewater
Average Chromium Concentration	0.00936 mg/L	0.005 mg/L
Total Chromium Mass	5.45 kg	2.91 kg

The concentrations of chromium in the porewater sample are approximately 47% lower compared to SPLP results (0.005 mg/L vs. 00936 mg/L). The total chromium mass in SPLP-derived estimates (5.45-5.82 kg) is greater than the porewater-derived estimate (2.91 kg).

The lower chromium concentrations in Dallman Ash Pond's porewater compared to SPLP results reflect redox and pH-controlled geochemical processes unique to in situ conditions. SPLP's acidic, oxygenated environment (pH 4.2) promotes chromium mobilization as soluble Cr(VI) (chromate, $HCrO_4^-$), while the pond's alkaline and reducing conditions (pH 8–12; low Eh) reduce Cr(VI) to Cr(III). This reduction triggers precipitation as insoluble Cr(III) hydroxides [$Cr(OH)_3$] or coprecipitation with iron oxides, sharply limiting dissolved chromium in porewater. Adsorption of Cr(III) onto clay minerals and organic matter further suppresses mobility under alkaline conditions.

Chromium's mobility is governed by three interdependent factors. These are: 1) Cr(VI) is highly mobile; Cr(III) is immobile; 2) alkaline conditions favor Cr(III) precipitation but can remobilize Cr(VI) as oxyanions; and 3) iron oxides and clays permanently sequester Cr(III).

In groundwater, chromium's nature and extent would depend on redox stability. If reducing conditions persist, migration would be minimal (< meters). However, oxidation during pond dewatering or acidic recharge could convert Cr(III) to mobile Cr(VI), potentially forming elongated plumes. The SPLP overestimates current risk (5.45–5.82 kg vs. porewater's 2.91 kg) because it ignores the pond's natural attenuation capacity. Long-term monitoring of Eh/pH is essential to detect shifts that could liberate Cr(VI).

Lakeside Ash Pond - SPLP/TCLP Results – Chromium

Cobalt concentrations were non-detect (<0.005 mg/L) for all samples. Using detection limit value (0.005 mg/L) the total mass of dissolved cobalt is:

= 0.005 mg/L x 582,000,000 L = 2.91 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum cobalt leaching rate per metric ton of ash is:

= 2.91 kg / 1,424,736 metric tons = 0.00204 g Cobalt/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Cobalt

Parameter	SPLP	Porewater
Average Cobalt Concentration	0.006 mg/L	0.005 mg/L
Total Cobalt Mass	3.49 kg	2.91 kg

The concentrations of cobalt, dissolved, in the porewater results are approximately 17% lower compared to SPLP samples (0.005 mg/L vs. 0.006 mg/L). The total cobalt mass in porewater is 2.91 kg, and the SPLP-derived estimate is 3.49 kg.

The close alignment between cobalt concentrations in Dallman Ash Pond's porewater and SPLP leachate reflects cobalt's consistent geochemical behavior across pH and redox gradients. Unlike redox-sensitive metals (e.g., Cr, As), cobalt solubility is primarily governed by pH-controlled precipitation and adsorption. In SPLP's acidic environment (pH 4.2), cobalt remains largely immobilized through adsorption onto Fe/Mn oxides and clay minerals. Conversely, in the pond's alkaline porewater (pH 8–12), cobalt precipitates as insoluble hydroxides ($Co(OH)_2$) or carbonates ($CoCO_3$), while also binding strongly to mineral surfaces. These parallel retention mechanisms, adsorption in acid, precipitation in alkali, converge to limit dissolved cobalt in both settings.

Cobalt mobility in groundwater is constrained by three key factors: 1) high K_d values (>500 L/kg) on Fe/Mn oxides, particularly in neutral-alkaline conditions; 2) precipitation as secondary minerals reduces dissolved concentrations; and 3) formation of immobile CoS in reducing zones.

These characteristics restrict cobalt plumes to short migration distances (<10–50 m typically), with sharp concentration declining downgradient. The minor mass difference likely stems from SPLP's partial dissolution of weakly adsorbed cobalt pools absent in porewater equilibrium. Overall, the agreement confirms cobalt's low leaching risk in CCR impoundments regardless of testing methodology, though slightly higher SPLP values appropriately represent a conservative leaching scenario for regulatory purposes.

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the average and maximum barium leaching rate per metric ton of ash is:

= 1.76 kg / 430,324 metric tons = 0.00409 g Barium/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Lakeside Ash Pond - Results Comparison – Cobalt

Parameter	SPLP	Porewater
Average Cobalt Concentration	0.006 mg/L	0.005 mg/L
Total Cobalt Mass	2.11 kg	1.76 kg

The concentrations of cobalt in porewater are approximately 17% lower compared to SPLP derived results (0.005 mg/L vs. 0.006 mg/L). The total cobalt mass in SPLP-derived estimates is 2.11 kg, is slightly higher than porewater estimates (1.76 kg). These results are similar to the Dallman Ash Pond SPLP and porewater analytical results. See discussion above.

6.8 Fluoride

The mass of chromium leachable from fly ash and bottom ash in a CCR surface impoundment was estimated from the "Shake Extraction" and porewater analytical results.

The soil samples were analyzed for dissolved fluoride using ASTM D3987 (SW-846 Method 9036) "Shake Extraction." This method represents a water-based leaching scenario designed to simulate the dissolution of soluble constituents when solid materials come into contact with natural freshwater under mild agitation.

Dallman Ash Pond – Shake Extraction Results – Fluoride

Method	Units	D1 19.5-21.5	D1 36.5-38.5	D2 19.5-21.5	D2 33.5-35.5	D3 4.5-6.5	D3 14.5-29.5	D4 19.5-21.5	D4 29.5-31.5	Min	Max	Avg
Shake Extraction	mg/L	0.13	0.19	0.2	J 0.37	J 0.08	0.11	J 0.06	0.14	0.06	0.37	0.16

Note:
J - Analyte detected below quantitation limits

The porewater volume of the surface impoundment is 582,000,000 L. Using an average concentration (0.16 mg/L) the total mass of fluoride is:

= 0.16 mg/L x 582,000,000 L = 93.1kg

Conservative estimate using the maximum concentration (0.37 mg/L) is:

= 0.37 mg/L x 582,000,000 L = 215 kg

Based upon a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum fluoride leaching rate per metric ton of ash is:

= 93.1 kg / 1,424,736 metric tons = 0.0653 g Fluoride/metric ton ash

= 215 kg / 1,424,736 metric tons = 0.151 g Fluoride/metric ton ash

Dallman Ash Pond - Porewater Results – Fluoride, total and dissolved

Method	Units	Date	D1	D2	D3	D4	Min	Max	Avg

Note:
J - Analyte detected below quantitation limits

Using average porewater data for fluoride, dissolved, the total mass is:

= 0.09 mg/L x 582,000,000 L = 52.4 kg

Conservative estimate using the maximum concentrations (0.12 mg/L) is:

= 0.12 mg/L x 582,000,000 L = 69.8 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum fluoride leaching rate per metric ton of ash is:

= 52.4 kg / 1,424,736 metric tons = 0.0368 g Fluoride/metric ton ash

= 69.8 kg / 1,424,736 metric tons = 0.0490 g Fluoride/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Fluoride

Parameter	SPLP	Porewater
Average Fluoride Concentration	0.16 mg/L	0.09 mg/L
Total Fluoride Mass	93.1 kg	52.4 kg

The concentrations of fluoride, dissolved, in the porewater sample are approximately 44% lower compared to shake extraction samples (0.16 mg/L vs. 0.09 mg/L). The total fluoride mass in shake extraction results is 93.1-215 kg, significantly higher than porewater derived estimates (52.4-69.8 kg).

The lower fluoride concentrations in Dallman Ash Pond's porewater compared to shake extraction results (0.16 mg/L) arise from methodological and geochemical factors. Shake extraction's aggressive agitation and acidic pH (typically pH ~4–5) dissolve weakly bound fluoride from mineral phases like fluorapatite [$Ca_5(PO_4)_3F$] or adsorb onto aluminum/iron oxides, amplifying release. In contrast, the alkaline porewater (pH 8–12) enhances fluoride adsorption onto positively charged Fe/Al-oxide surfaces and promotes precipitation as CaF_2 (fluorite), suppressing dissolved concentrations.

Fluoride mobility in groundwater is governed by three key characteristics: 1) mobility peaks in acidic conditions (pH < 6) where OH^- competition is minimal; 2) higher Ca^{2+} promotes CaF_2 precipitation, immobilizing fluoride; and 3) fluorite controls long-term release, with dissolution favored by low Ca^{2+}/high CO_3^{2-}.

In this setting, alkaline porewater and abundant calcium in ash limit fluoride mobility, confining plumes near source zones. The shake extraction overestimates mass (93–215 kg vs. porewater's 53–70 kg) because it disrupts natural equilibrium, dissolving pools not readily available under field conditions. Actual groundwater impacts would depend on downgradient pH and calcium levels, with advection dominating transport but attenuation likely within short distances due to adsorption/precipitation.

Lakeside Ash Pond – Shake Extraction Results – Fluoride

Method	Units	L1 14.5-21.5	L1 24.5-31.5	L3 19.5-21.5	L3 29.5-32.7	L4 10-15.3	L5 19.5-21.5	L5 32.5-35.2	Min	Max	Avg
SPLP	mg/L	0.37	0.21	0.2	0.2	0.42	0.36	J 0.08	0.08	0.42	0.263

Note:
J - Analyte detected below quantitation limits

The porewater volume of the surface impoundment is 351,572,000 L. Fluoride concentrations ranged from a trace amount of 0.08 mg/L to 0.42 mg/L. Using an average concentration (0.263 mg/L) the total mass of fluoride is:

= 0.263 mg/L x 351,572,000 L = 92.5 kg

Conservative estimate using the maximum concentration (0.42 mg/L) is:

= 0.42 mg/L x 351,572,000 L = 148 kg

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the fluoride leaching rate per metric ton of ash is:

= 92.5 kg / 430,324 metric tons = 0.215 g Fluoride/metric ton ash

= 148 kg / 430,324 metric tons = 0.344 g Fluoride/metric ton ash

Lakeside Ash Pond - Porewater Results – Fluoride, total and dissolved

Method	Units	Date	L1	L3	L4	L5	Min	Max	Avg
Total	mg/L	4/29/24	0.5	1.07	1.19	1.32	0.5	1.32	1.02
Dissolved	mg/L	7/19/24	0.1	0.35	0.62	0.37	0.1	0.62	0.36
Total	mg/L	7/19/24	0.11	0.36	0.64	0.38	0.11	0.64	0.373

Using average porewater data for fluoride, dissolved, the total mass is:

= 0.36 mg/L x 351,572,000 L = 127 kg

Conservative estimate using the maximum concentration (0.62 mg/L) is:

= 0.62 mg/L x 351,572,000 L = 218 kg

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the average and maximum fluoride leaching rate per metric ton of ash is:

= 127 kg / 430,324 metric tons = 0.294 g Fluoride/metric ton ash

= 218 kg / 430,324 metric tons = 0.507 g Fluoride/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Lakeside Ash Pond - Results Comparison – Fluoride

Parameter	SPLP	Porewater
Average Fluoride Concentration	0.263 mg/L	0.36 mg/L
Total Fluoride Mass	92.5 kg	127 kg

The concentrations of fluoride in the shake extraction sample are approximately 27% lower compared to porewater results (0.263 mg/L vs. 0.36 mg/L). The total fluoride mass in porewater is 127-218 kg, higher than shake extraction derived estimates (92.5-148 kg).

The higher fluoride concentrations in Lakeside Ash Pond's porewater compared to shake extraction results reflect pH-driven geochemical processes that suppress fluoride release in acidic leaching tests but enhance solubility in alkaline field conditions. Shake extraction's low-pH environment (typically pH 4–5) promotes fluoride adsorption onto positively charged mineral surfaces (e.g., Al-/Fe-oxides) and may trigger precipitation as CaF_2 if calcium is abundant in the leachant. Conversely, the pond's alkaline porewater (pH 8–12) generates negatively charged mineral surfaces that repel fluoride anions, while high bicarbonate concentrations compete for adsorption sites, collectively increasing dissolved fluoride.

Fluoride mobility is primarily controlled by three factors: 1) pH, which reverses adsorption behavior (immobile in acid, mobile in alkali); 2) calcium availability, where high Ca^{2+} induces fluorite precipitation; and 3) competing anions (e.g., HCO_3^-, SO_4^{2-}) that displace adsorbed fluoride.

In groundwater, fluoride plumes may extend farther in alkaline, low-calcium settings but will attenuate rapidly if downgradient conditions favor adsorption (pH < 6) or precipitation (high Ca^{2+}). The shake extraction underestimates mass (92.5–148 kg vs. porewater's 127–218 kg) because its artificial chemistry immobilizes fluoride through mechanisms not representative of in-situ alkalinity. This highlights the importance of porewater data for predicting actual contaminant flux, particularly where pH deviates from neutral.

6.9 Lead

The mass of lead leachable from fly ash and bottom ash in a CCR surface impoundment was estimated from the SPLP and porewater analytical results.

Dallman Ash Pond - SPLP/TCLP Results – Lead

Method	Units	D1 19.5-21.5	D1 36.5-38.5	D2 19.5-21.5	D2 33.5-35.5	D3 4.5-6.5	D3 14.5-29.5	D4 19.5-21.5	D4 29.5-31.5	Min	Max	Avg

Note:
J - Analyte detected below quantitation limits

Using average porewater data for lead, dissolved, (0.0075) the total mass is:

= 0.0075 mg/L x 582,000,000 L = 4.37 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum lead leaching rate per metric ton of ash is:

= 4.37 kg / 1,424,736 metric tons = 0.00306 g Lead/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Lead

Parameter	SPLP	Porewater
Average Lead Concentration	0.0075 mg/L	0.0075 mg/L
Total Lead Mass	4.37 kg	4.37 kg

The concentrations of lead in the SPLP sample are the same calculated to the porewater results (0.0075 mg/L vs. 0.0075 mg/L). The total lead mass in porewater is 4.37 kg, is the same for the SPLP-derived estimates (4.37 kg).

The identical lead concentrations (0.0075 mg/L) and total mass (4.37 kg) in both SPLP and porewater samples from Dallman Ash Pond result from lead's unique geochemical behavior, which minimizes solubility across a wide range of conditions. In SPLP's acidic environment (pH 4.2), lead precipitates as insoluble anglesite ($PbSO_4$) due to sulfate in the leachant, while in the pond's alkaline porewater (pH 8–12), it forms stable cerussite ($PbCO_3$) or hydroxides. Additionally, lead adsorbs strongly to iron/aluminum oxides and clay minerals in ash regardless of pH, with distribution coefficients (K_d) typically >10^4 L/kg. These parallel immobilization mechanisms—precipitation and adsorption—suppress dissolution equally in both test methods.

Lead's mobility in groundwater is inherently low due to three key characteristics: 1) sulfate or carbonate availability triggers near-instantaneous mineral formation; 2) strong surface bonding persists across pH gradients; and 3) lead lacks soluble oxidized species, unlike chromium or arsenic.

Consequently, lead plumes rarely extend beyond local zones (<50 m) unless exposed to unusually acidic, low-sulfate, or low-carbonate groundwater. The SPLP-porewater agreement confirms that standardized leaching tests reliably predict lead's low environmental mobility in coal ash impoundments. However, long-term stability depends on maintaining geochemical conditions that favor precipitation—particularly avoiding acidic groundwater intrusion that could dissolve mineral phases.

Lakeside Ash Pond - SPLP/TCLP Results – Lead

Method	Units	L1 14.5-21.5	L1 24.5-31.5	L3 19.5-21.5	L3 29.5-32.7	L4 10-15.3	L5 19.5-21.5	L5 32.5-35.2	Min	Max	Avg
SPLP	mg/L	< 0.0075	< 0.0075	< 0.0075	< 0.0075	< 0.0075	< 0.0075	< 0.0075	0.0075	0.0075	0.0075

The porewater volume of the surface impoundment is 351,572,000 L. Lead concentrations were non-detect (<0.0075 mg/L) for all SPLP samples. Using detection limit value (0.0075 mg/L) the total mass of lead is:

= 0.0075 mg/L x 351,572,000 L = 2.64 kg

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the lead leaching rate per metric ton of ash is:

= 2.64 kg / 430,324 metric tons = 0.00613 g Lead/metric ton ash

Lakeside Ash Pond - Porewater Results – Lead, total and dissolved

Method	Units	Date	L1	L3	L4	L5	Min	Max	Avg

Note:
B - Analyte detected in associated Method Blank

The dissolved lead concentrations were reported as non-detect (<0.0075 mg/L) for all sampling events. Using the average porewater data for lead, dissolved (0.0075), the total mass is:

= 0.0075 mg/L x 351,572,000 L = 2.64 kg

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the average and maximum lead leaching rate per metric ton of ash is:

= 2.64 kg / 430,324 metric tons = 0.00613 g Lead/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Lakeside Ash Pond - Results Comparison – Lead

Parameter	SPLP	Porewater
Average Lead Concentration	0.0075 mg/L	0.0075 mg/L
Total Lead Mass	2.64 kg	2.64 kg

Similar to the Dallman Ash Pond results, the concentrations of lead in the SPLP sample are similar to porewater results (0.0075 mg/L vs. 0.0075 mg/L). The total lead mass in porewater is 2.64 kg, the same as the SPLP-derived estimates (2.64 kg). See discussion above.

6.10 Lithium

The mass of lithium leachable from fly ash and bottom ash in a CCR surface impoundment was estimated from the SPLP and porewater analytical results.

Dallman Ash Pond - SPLP/TCLP Results – Lithium

Method	Units	D1 19.5-21.5	D1 36.5-38.5	D2 19.5-21.5	D2 33.5-35.5	D3 4.5-6.5	D3 14.5-29.5	D4 19.5-21.5	D4 29.5-31.5	Min	Max	Avg

The porewater volume of the surface impoundment is 582,000,000 L. Using an average concentration (0.00611 mg/L) the total mass of lithium is:

= 0.00611 mg/L x 582,000,000 L = 3.56 kg

Conservative estimate using the maximum concentration (0.0112 mg/L) is:

= 0.0112 mg/L x 582,000,000 L = 6.52 kg

Based upon a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum lithium leaching rate per metric ton of ash is:

= 3.56 kg / 1,424,736 metric tons = 0.00250 g Lithium/metric ton ash

= 6.52 kg / 1,424,736 metric tons = 0.00458 g Lithium/metric ton ash

Dallman Ash Pond - Porewater Results – Lithium, total and dissolved

Method	Units	Date	D1	D2	D3	D4	Min	Max	Avg
Total	mg/L	4/29/24	0.428	0.154	0.571	0.228	0.154	0.571	0.345
Dissolved	mg/L	7/19/24	0.207	0.0963	0.117	0.261	0.0963	0.261	0.170
Total	mg/L	7/19/24	0.273	0.11	0.11	0.298	0.11	0.298	0.198

Using average porewater data for lithium, dissolved, the total mass is:

= 0.17 mg/L x 582,000,000 L = 98.9 kg

Conservative estimate using the maximum concentrations (0.298 mg/L) is:

= 0.261 mg/L x 582,000,000 L = 152 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum lithium leaching rate per metric ton of ash is:

= 98.9 kg / 1,424,736 metric tons = 0.0694 g Lithium/metric ton ash

= 152 kg / 1,424,736 metric tons = 0.107 g Lithium/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Lithium

Parameter	SPLP	Porewater
Average Lithium Concentration	0.00611 mg/L	0.170 mg/L
Total Lithium Mass	3.56 kg	98.9 kg

The concentrations of lithium in the SPLP sample are approximately 96% lower compared to porewater results (0.00611 mg/L vs. 0.170 mg/L). The total lithium mass in porewater is 98.9-152 kg, significantly higher than SPLP-derived estimates (3.56-6.52 kg).

The substantial difference in lithium concentrations with porewater results stems from lithium's unique geochemistry in coal ash environments and methodological limitations of leaching tests. The key drivers of the discrepancy are pH-dependent mobilization, mineral dissolution and absence of precipitation controls.

SPLP's acidic leachant (pH 4.2) promotes ion exchange of Li^+ onto clay minerals and metal oxides in ash, temporarily sequestering it. Alkaline porewater (pH 8–12) enhances Li^+ solubility due to repulsive electrostatic forces on negatively charged mineral surfaces, and competition with Na^+/K^+ (abundant in ash porewater) for sorption sites.

Lithium is often hosted in soluble glassy phases of fly ash. Alkaline conditions gradually dissolve these phases, releasing Li^+ into porewater, a process not replicated in short-duration SPLP tests.

Unlike metals (e.g., Pb, Ba), lithium lacks insoluble precipitates, allowing it to accumulate in solution under favorable pH.

Lithium's mobility in groundwater is exceptionally high due to: 1) minimal adsorption (low K_d ~1–10 L/kg); 2) no redox sensitivity or hydrolysis; and 3) high solubility across all pH ranges.

Once released, lithium behaves conservatively (similar to chloride), migrating with advective flow and forming extensive plumes. Its actual extent depends solely on hydraulic residence time and dilution, not chemical attenuation.

SPLP's acidic, low-ionic-strength chemistry fails to replicate the alkaline, ion-rich porewater that liberates lithium. The test thus grossly underestimates in-situ leaching potential. Porewater data is essential to identify lithium as a high-mobility contaminant in CCR impoundments.

Total	mg/L	7/19/24	0.0562	0.0899	0.0522	0.217	0.0522	0.217	0.104

Using average porewater data for lithium, dissolved, the total mass is:

= 0.0618 mg/L x 351,572,000 L = 21.7 kg

Conservative estimate using the maximum concentration (0.144 mg/L) is:

= 0.144 mg/L x 351,572,000 L = 50.6 kg

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the average and maximum lithium leaching rate per metric ton of ash is:

= 21.7 kg / 430,324 metric tons = 0.0505 g Barium/metric ton ash

= 50.6 kg / 430,324 metric tons = 0.118 g Barium/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Lakeside Ash Pond - Results Comparison – Lithium

Parameter	SPLP	Porewater
Average Lithium Concentration	0.00279 mg/L	0.0618 mg/L
Total Lithium Mass	0.981 kg	21.7 kg

Similar to the Dallman Ash Pond results, the concentrations of lithium in the SPLP sample are approximately 88% lower compared to porewater results (0.00279 mg/L vs. 0.0618 mg/L). The total lithium mass in porewater is 21.7-50.6 kg, significantly higher than SPLP-derived estimates (0.981-1.16 kg). See discussion above.

6.11 Mercury

The mass of mercury leachable from fly ash and bottom ash in a CCR surface impoundment was estimated from the SPLP and porewater analytical results.

Dallman Ash Pond - SPLP/TCLP Results – Mercury

Method	Units	D1 19.5-21.5	D1 36.5-38.5	D2 19.5-21.5	D2 33.5-35.5	D3 4.5-6.5	D3 14.5-29.5	D4 19.5-21.5	D4 29.5-31.5	Min	Max	Avg

The porewater volume of the surface impoundment is 582,000,000 L. Mercury concentrations were non-detect (<0.0002 mg/L) for all SPLP samples. Using detection limit value (0.0002 mg/L) the total mass of mercury is:

= 0.0002 mg/L x 582,000,000 L = 0.116 kg

Based upon a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the mercury leaching rate per metric ton of ash is:

= 0.116 kg / 1,424,736 metric tons = 0.0000814 g Mercury/metric ton ash

Dallman Ash Pond - Porewater Results – Mercury, total and dissolved

Method	Units	Date	D1	D2	D3	D4	Min	Max	Avg
Total	mg/L	4/29/24	0.00562	0.00046	H 0.00685	0.00717	0.00046	0.00717	0.005025
Dissolved	mg/L	7/19/24	< 0.0002	< 0.0002	< 0.0002	< 0.0002	0.0002	0.0002	0.0002
Total	mg/L	7/19/24	< 0.0002	< 0.0002	< 0.0002	< 0.0002	0.0002	0.0002	0.0002

Mercury concentrations were non-detect (<0.0002 mg/L) for all dissolved mercury porewater samples. Using the detection limit value (0.0002 mg/L) the total mass of mercury is:

= 0.0002 mg/L x 582,000,000 L = 0.116 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum mercury leaching rate per metric ton of ash is:

= 0.116 kg / 1,424,736 metric tons = 0.0000814 g Mercury/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Mercury

Parameter	SPLP	Porewater
Maximum Mercury Concentration	0.0002 mg/L	0.0002 mg/L
Total Mercury Mass	0.116 kg	0.116 kg

The concentrations of mercury for both the SPLP and porewater samples were non-detect (<0.0002 mg/L). The total mercury mass is estimated to be 0.116 kg.

The non-detect mercury results in both SPLP and porewater samples from Dallman Ash Pond reflect mercury's extreme immobility in coal ash environments. Three geochemical factors drive this behavior: 1) mercury readily volatilizes during coal combustion, leaving minimal soluble Hg^{2+} in ash; 2) residual mercury adsorbs irreversibly to carbon particles or sulfides in ash, forming insoluble complexes (e.g., HgS, Hg^0); and 3) submerged, reducing conditions in the pond favor precipitation as cinnabar (HgS) or amalgamation with other metals.

Mercury's mobility is inherently low due to high affinity for organic/sulfide phases (log K_d<5), volatility limiting aqueous residence, and reduction to insoluble Hg^0 under anoxia.

Consequently, mercury rarely migrates beyond ash deposits, posing negligible groundwater risk. The non-detects in both methods confirm that standardized leaching tests and porewater sampling align for mercury, unlike mobile constituents (e.g., Li, As), due to its near-total sequestration. Any long-term release would require oxidation or sulfide dissolution, which is unlikely in stable impoundments.

Mercury concentrations were non-detect (<0.0002 mg/L) for all dissolved mercury porewater samples. Using the detection limit value (0.0002 mg/L) the total mass of mercury is:

= 0.0002 mg/L x 351,572,000 L = 0.0703 kg

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the average and maximum mercury leaching rate per metric ton of ash is:

= 0.0703 kg / 430,324 metric tons = 0.000163 g Mercury/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Lakeside Ash Pond - Results Comparison – Mercury

Parameter	SPLP	Porewater
Average Mercury Concentration	0.0002 mg/L	0.0002 mg/L
Total Mercury Mass	0.0703 kg	0.0703 kg

The concentrations of mercury in the SPLP sample are the same as the porewater results (0.0002 mg/L vs. 0.0002 mg/L). The total mercury mass in porewater and SPLP samples is 0.0703 kg. These results are similar to the Dallman Ash Pond SPLP and porewater analytical results. See discussion above.

6.12 Molybdenum

The mass of molybdenum leachable from fly ash and bottom ash in a CCR surface impoundment was estimated from the SPLP and porewater analytical results.

Dallman Ash Pond - SPLP/TCLP Results – Molybdenum

Method	Units	D1 19.5-21.5	D1 36.5-38.5	D2 19.5-21.5	D2 33.5-35.5	D3 4.5-6.5	D3 14.5-29.5	D4 19.5-21.5	D4 29.5-31.5	Min	Max	Avg
SPLP	mg/L	0.216	0.144	0.155	5.21	0.0138	0.0355	0.0495	0.134	0.0138	5.21	0.745
TCLP	mg/L	0.0402	0.0554	0.0571	1.27	0.0375	0.0415	0.105	0.179	0.0375	1.27	0.223

The porewater volume of the surface impoundment is 582,000,000 L. Using an average concentration (0.745 mg/L) the total mass of molybdenum is:

= 0.745 mg/L x 582,000,000 L = 434 kg

Conservative estimate using the maximum concentration (5.21 mg/L) is:

= 5.21 mg/L x 582,000,000 L = 3,030 kg

Based upon a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum molybdenum leaching rate per metric ton of ash is:

= 434 kg / 1,424,736 metric tons = 0.305 g Molybdenum/metric ton ash

= 3,030 kg / 1,424,736 metric tons = 2.13 g Molybdenum/metric ton ash

Dallman Ash Pond - Porewater Results – Molybdenum, total and dissolved

Method	Units	Date	D1	D2	D3	D4	Min	Max	Avg
Total	mg/L	4/29/24	15.7	8.04	2.61	2.3	2.3	15.7	7.16
Dissolved	mg/L	7/19/24	10.4	6.58	2.78	3.61	2.78	10.4	5.84
Total	mg/L	7/19/24	11.7	7.04	2.89	3.77	2.89	11.7	6.35

Using average porewater data for molybdenum, dissolved, the total mass is:

= 5.84 mg/L x 582,000,000 L = 3,399 kg

Conservative estimate using the maximum concentrations (10.4 mg/L) is:

= 5.84 mg/L x 582,000,000 L = 6,053 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum molybdenum leaching rate per metric ton of ash is:

= 3,399 kg / 1,424,736 metric tons = 2.39 g Molybdenum/metric ton ash

= 6,053 kg / 1,424,736 metric tons = 4.25 g Molybdenum/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Molybdenum

Parameter	SPLP	Porewater
Average Molybdenum Concentration	0.745 mg/L	5.84 mg/L
Total Molybdenum Mass	434 kg	3,399 kg

The concentrations of molybdenum in the SPLP sample are approximately 87% lower compared to porewater results (0.745 mg/L vs. 5.84 mg/L). The total molybdenum mass in porewater is 3,399-6,053 kg, significantly higher than SPLP-derived estimates (434-3,030 kg).

The stark difference in molybdenum concentrations stems from molybdenum's unique pH-dependent geochemistry and the contrasting conditions of the tests.

SPLP's acidic environment (pH 4.2) triggers molybdenum adsorption onto iron/aluminum oxides and clay minerals, where it forms strong inner-sphere complexes (e.g., ≡Fe–MoO_4^+). This immobilizes dissolved molybdenum. Conversely, the alkaline porewater (pH 8–12) in the ash pond generates negatively charged mineral surfaces that repel molybdate anions (MoO_4^{2-}), while high pH also dissolves Mo-bearing phases (e.g., powellite, $CaMoO_4$), enhancing solubility.

Molybdenum's mobility is exceptionally high in alkaline settings due to: 1) as an oxyanion, it resists adsorption at high pH; 2) few insoluble phases form in typical groundwater; and 3) Mo(VI) dominates across most Eh conditions.

Once released, molybdenum migrates conservatively with groundwater flow, forming extensive plumes with minimal attenuation—unlike cationic metals (e.g., Pb, Cd) that adsorb or precipitate.

SPLP's low-pH chemistry artificially immobilizes molybdenum through adsorption mechanisms irrelevant to the actual alkaline impoundment. Porewater data thus reveals the true leaching potential, confirming molybdenum as a high-priority contaminant in CCR sites. Its long-term mobility depends solely on pH stability; acidification could reduce flux, but alkaline plumes may migrate kilometers downgradient.

Note:
J - Analyte detected below quantitation limits

The porewater volume of the surface impoundment is 351,572,000 L. Using an average concentration (0.0229 mg/L) the total mass of molybdenum is:

= 0.0229 mg/L x 351,572,000 L = 8.05 kg

Conservative estimate using the maximum concentration (0.0904 mg/L) is:

= 0.0904 mg/L x 351,572,000 L = 31.8 kg

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the average and maximum molybdenum leaching rate per metric ton of ash is:

= 8.05 kg / 430,324 metric tons = 0.0187 g Molybdenum/metric ton ash

= 31.8 kg / 430,324 metric tons = 0.0739 g Molybdenum/metric ton ash

Lakeside Ash Pond - Porewater Results – Molybdenum, total and dissolved

Method	Units	Date	L1	L3	L4	L5	Min	Max	Avg
Total	mg/L	4/29/24	0.161	0.218	0.0218	0.282	0.0218	0.282	0.171
Dissolved	mg/L	7/19/24	0.0903	0.0571	< 0.01	0.366	0.01	0.366	0.131
Total	mg/L	7/19/24	0.0942	0.0611	0.01	0.378	0.01	0.378	0.136

Using average porewater data for molybdenum, dissolved, the total mass is:

= 0.131 mg/L x 351,572,000 L = 46.1 kg

Conservative estimate using the maximum concentration (0.378 mg/L) is:

= 0.366 mg/L x 351,572,000 L = 129 kg

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the average and maximum molybdenum leaching rate per metric ton of ash is:

= 46.1 kg / 430,324 metric tons = 0.107 g Molybdenum/metric ton ash

= 129 kg / 430,324 metric tons = 0.299 g Molybdenum/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Lakeside Ash Pond - Results Comparison – Molybdenum

Parameter	SPLP	Porewater
Average Molybdenum Concentration	0.0229 mg/L	0.131 mg/L
Total Molybdenum Mass	8.05 kg	46.1 kg

Similar to the Dallman Ash Pond results, the concentrations of molybdenum in the SPLP sample are approximately 83% lower compared to porewater results (0.0229 mg/L vs. 0.131 mg/L). The total molybdenum mass in porewater is 46.1-129 kg, significantly higher than SPLP-derived estimates (8.05-31.8 kg). See discussion above.

6.13 Selenium

The mass of selenium leachable from fly ash and bottom ash in a CCR surface impoundment was estimated from the SPLP and porewater analytical results.

Dallman Ash Pond - SPLP/TCLP Results – Selenium

Method	Units	D1 19.5-21.5	D1 36.5-38.5	D2 19.5-21.5	D2 33.5-35.5	D3 4.5-6.5	D3 14.5-29.5	D4 19.5-21.5	D4 29.5-31.5	Min	Max	Avg

Note:
J - Analyte detected below quantitation limits

Using average porewater data for selenium, dissolved, the total mass is:

= 0.0628 mg/L x 582,000,000 L = 36.5 kg

Conservative estimate using the maximum concentrations (0.143 mg/L) is:

= 0.143 mg/L x 582,000,000 L = 83.2 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum selenium leaching rate per metric ton of ash is:

= 36.5 kg / 1,424,736 metric tons = 0.0257 g Selenium/metric ton ash

= 83.2 kg / 1,424,736 metric tons = 0.0584 g Selenium/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Selenium

Parameter	SPLP	Porewater
Average Selenium Concentration	0.0403 mg/L	0.0628 mg/L
Total Selenium Mass	23.5 kg	36.5 kg

The concentrations of selenium in the SPLP sample are approximately 36% lower compared to porewater results (0.0403 mg/L vs. 0.0628 mg/L). The total selenium mass in porewater is 36.5-83.2 kg, significantly higher than SPLP-derived estimates (23.5-29.1 kg).

The higher selenium concentrations in Dallman Ash Pond's porewater compared to SPLP results with porewater mass estimates significantly exceeding SPLP-derived values result from selenium's redox-driven geochemistry and the contrasting conditions between field and lab environments. In SPLP's acidic (pH 4.2), oxygenated setting, selenium adsorbs strongly to iron oxides as immobile selenite [Se(IV)]. Conversely, the pond's alkaline (pH 8–12) reducing conditions stabilize mobile selenite [Se(IV)] while suppressing further reduction to insoluble elemental selenium [Se(0)]. This partial reduction traps selenium in its soluble Se(IV) form, enhancing porewater concentrations.

Selenium mobility hinges on three factors: 1) oxic conditions favor mobile selenate [Se(VI)]; reducing environments stabilize Se(IV) or Se(0); 2) alkaline conditions diminish adsorption of Se(IV) onto mineral surfaces; 3) sulfate and bicarbonate in porewater displace adsorbed selenium.

In groundwater, selenium's extent is determined by redox gradients. If reducing conditions persist, Se(IV) migrates moderately via advection but may attenuate where full reduction to Se(0) occurs. Oxidation during pond closure could convert Se(IV) to highly mobile Se(VI), forming extensive plumes. SPLP underestimates in-situ selenium because its acidic, oxic chemistry immobilizes selenium through adsorption irrelevant to the pond's actual reducing, alkaline environment. Porewater data thus better reflects current leaching risk, though long-term stability depends on maintaining reducing conditions to limit Se(VI) generation.

Lakeside Ash Pond - SPLP/TCLP Results – Selenium

Method	Units	L1 14.5-21.5	L1 24.5-31.5	L3 19.5-21.5	L3 29.5-32.7	L4 10-15.3	L5 19.5-21.5	L5 32.5-35.2	Min	Max	Avg

Total	mg/L	7/19/24	J 0.026	J 0.027	0.0428	J 0.028	0.026	0.0428	0.0310

Note:
J - Analyte detected below quantitation limits

Using average porewater data for selenium, dissolved, the total mass is:

= 0.0354 mg/L x 351,572,000 L = 12.4 kg

Conservative estimate using the maximum concentration (0.0456 mg/L) is:

= 0.0456 mg/L x 351,572,000 L = 16.0 kg

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the average and maximum selenium leaching rate per metric ton of ash is:

= 12.4 kg / 430,324 metric tons = 0.0289 g Selenium/metric ton ash

= 16.0 kg / 430,324 metric tons = 0.0373 g Selenium/metric ton ash

Comparison of the conservative porewater results with the SPLP estimate:

Lakeside Ash Pond - Results Comparison – Selenium

Parameter	SPLP	Porewater
Average Selenium Concentration	0.0456 mg/L	0.0354 mg/L
Total Selenium Mass	16.0 kg	12.4 kg

The concentrations of selenium, dissolved, in the porewater sample are approximately 22% lower compared to SPLP results (0.0354 mg/L vs. 0.0456 mg/L). The total selenium mass in porewater is 12.4-16.0 kg, is slightly lower than SPLP-derived estimates (16.0-17.6 kg).

Selenium is a redox-sensitive anion-forming element commonly associated with coal combustion residues and is known for its potential environmental mobility and ecological effects.

The SPLP result for the Lakeside Ash Pond was unexpectedly higher than porewater, suggesting the acidic SPLP leachate (pH ~4.2–4.8) may promote desorption or dissolution of selenium from ash surfaces that are otherwise more stable under neutral pH porewater conditions. The SPLP test environment is more oxidizing, favoring formation and release of selenate, the more mobile selenium species. The SPLP test may extract selenium that is not readily soluble under in-situ conditions but becomes mobilized under artificial laboratory conditions.

The selenium SPLP mass estimates for the Lakeside Ash Pond are only modestly greater, suggesting that field porewater concentrations reflect a reasonably representative long-term leaching scenario. SPLP overestimates mobility for selenium under certain conditions by not accounting for redox-controlled sorption or retention processes present in the field.

Given that the total selenium mass estimates differ by less than a factor of two, both datasets may be considered complementary for characterizing selenium mobility, with field conditions providing the more environmentally relevant perspective.

6.14 Thallium

The mass of thallium leachable from fly ash and bottom ash in a CCR surface impoundment was estimated from the SPLP and porewater analytical results.

Dallman Ash Pond - SPLP/TCLP Results – Thallium

Method	Units	D1 19.5-21.5	D1 36.5-38.5	D2 19.5-21.5	D2 33.5-35.5	D3 4.5-6.5	D3 14.5-29.5	D4 19.5-21.5	D4 29.5-31.5	Min	Max	Avg

Note:
J - Analyte detected below quantitation limits

The porewater volume of the surface impoundment is 582,000,000 L. Using an average concentration (0.165 mg/L) the total mass of thallium is:

= 0.00165 mg/L x 582,000,000 L = 0.960 kg

Conservative estimate using the maximum concentration (0.002 mg/L) is:

= 0.002 mg/L x 582,000,000 L = 1.16 kg

Based upon a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum thallium leaching rate per metric ton of ash is:

= 0.960kg / 1,424,736 metric tons = 0.000674 g Thallium/metric ton ash

= 1.16 kg / 1,424,736 metric tons = 0.000814 g Thallium/metric ton ash

Dallman Ash Pond - Porewater Results – Thallium, total and dissolved

Method	Units	Date	D1	D2	D3	D4	Min	Max	Avg
Total	mg/L	4/29/24	J 0.13	J 0.049	0.274	J 0.066	0.049	0.274	0.130
Dissolved	mg/L	7/19/24	< 0.002	< 0.002	0.0021	J 0.0017	0.0017	0.0021	0.00195
Total	mg/L	7/19/24	0.0035	0.0044	0.003	0.0071	0.003	0.0071	0.0045

Note:
J - Analyte detected below quantitation limits

Using average porewater data for thallium, dissolved, the total mass is:

= 0.00195 mg/L x 582,000,000 L = 1.13 kg

Conservative estimate using the maximum concentrations (0.0021 mg/L) is:

= 0.0021 mg/L x 582,000,000 L = 1.22 kg

Using a total ash mass in the surface impoundment of 1,424,736,000 kg (1.42 million metric tons), the average and maximum thallium leaching rate per metric ton of ash is:

= 1.13 kg / 1,424,736 metric tons = 0.000797 g Thallium/metric ton ash

= 1.22 kg / 1,424,736 metric tons = 0.000858 g Thallium/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Dallman Ash Pond - Results Comparison – Thallium

Parameter	SPLP	Porewater
Average Thallium Concentration	0.00165 mg/L	0.00195 mg/L
Total Thallium Mass	0.960 kg	1.13 kg

The concentrations of thallium in the SPLP sample are approximately 15% lower compared to porewater results (0.00165 mg/L vs. 0.00195 mg/L). The total thallium mass in porewater is 1.13-1.22 kg, somewhat higher than SPLP-derived estimates (0.960-1.16 kg).

The modestly higher thallium concentrations in Dallman Ash Pond's porewater compared to SPLP results arise from thallium's unique cationic geochemistry and subtle pH-dependent interactions. In SPLP's acidic environment (pH 4.2), thallium (Tl^+) competes with abundant H^+ ions for sorption sites on clay minerals and metal oxides, partially suppressing dissolution. Conversely, the alkaline porewater (pH 8–12) contains high concentrations of Na^+ and K^+ (common in coal ash leachates), which displace weakly adsorbed Tl^+ from exchange sites via ion competition, enhancing its solubility. This ion exchange effect, absent in SPLP's low-ionic-strength leachant, drives the small but consistent increase in porewater concentrations.

Thallium mobility in groundwater is governed by three key characteristics: 1) Tl^+ adsorbs moderately to clay/oxide surfaces (K_d ~10–100 L/kg), but is readily displaced by K^+/Na^+; 2) unlike metals like lead, thallium lacks highly insoluble phases; and 3) Tl(I) dominates in most conditions, though oxidation to Tl(III) can occur in Mn-rich settings.

These traits allow thallium to migrate farther than strongly sorbed metals (e.g., lead) but not as conservatively as anions (e.g., molybdenum). Plumes typically extend 100–500 meters downgradient, attenuated gradually by adsorption. The SPLP slightly under predicts in-situ mobility because it fails to replicate the ion-rich porewater that liberates Tl^+ via competition. While the mass difference is small (~15%), porewater data better reflects actual flux, particularly in alkaline CCR impoundments where cation competition is pronounced. Long-term risks depend on downgradient potassium/sodium levels and pH stability.

Lakeside Ash Pond - SPLP/TCLP Results – Thallium

Method	Units	L1 14.5-21.5	L1 24.5-31.5	L3 19.5-21.5	L3 29.5-32.7	L4 10-15.3	L5 19.5-21.5	L5 32.5-35.2	Min	Max	Avg

Note:
J - Analyte detected below quantitation limits

Using average porewater data for thallium, dissolved, the total mass is:

= 0.00208 mg/L x 351,572,000 L = 0.731 kg

Conservative estimate using the maximum concentration (0.0023 mg/L) is:

= 0.0023 mg/L x 351,572,000 L = 0.809 kg

Based upon a total ash mass in the surface impoundment of 430,324,128 kg (0.430 million metric tons), the average and maximum thallium leaching rate per metric ton of ash is:

= 0.731 kg / 430,324 metric tons = 0.00170 g Thallium/metric ton ash

= 0.809 kg / 430,324 metric tons = 0.00188 g Thallium/metric ton ash

Comparison of the porewater results with the SPLP estimate:

Lakeside Ash Pond - Results Comparison – Thallium

Parameter	SPLP	Porewater
Average Thallium Concentration	0.00186 mg/L	0.00208 mg/L
Total Thallium Mass	0.654 kg	0.731 kg

Similar to the Dallman Ash Pond, the concentrations of thallium in the Lakeside Ash Pond SPLP sample are approximately 11% lower compared to porewater results (0.00186 mg/L vs. 0.00208 mg/L). The total thallium mass in porewater is 0.731-0.809 kg, higher than SPLP-derived estimates (0.654-0.703 kg). See discussion above.

6.15 Radium 226 and 228 combined

The mass of radium 226 and radium 228 combined leachable from fly ash and bottom ash in a CCR surface impoundment was estimated from the solids and porewater analytical results.

The radium 226 and radium 228 CCR solids samples were analyzed using SW-846 Method 9315 and SW-846 Method 9320. Method 9315 is used to determine the concentrations of radium-226 (Ra-226) and radium-228 (Ra-228) in solid and aqueous environmental samples (e.g., soil, sediment, sludge, ash, and groundwater). Method 9320 is used to measure the concentration of radium-226 (Ra-226) in water samples (specifically drinking water, groundwater, and surface water).

The radium 226 and radium 228 CCR porewater samples were analyzed using EPA 903.0 and EPA 904.0, respectively.

Dallman Ash Pond - Results – Radium 226 and 228 combined

		D1	D1	D2	D2	D3	D3	D4	D4			
Method	Units	19.5-21.5	36.5-38.5	19.5-21.5	33.5-35.5	4.5-6.5	14.5-29.5	19.5-21.5	29.5-31.5	Min	Max	Avg
9315/9320	pCi/g	< 2	< 2	< 2	< 2	< 2		< 2	< 2	2	2	2

The total mass of combined Radium-226 and Radium-228 in the surface impoundment is based on the given concentration in the ash solids. Given a radium-226 and radium-228 combined concentration of 2 pCi/g (in ash), and a total ash mass of 1,424,736,000 kg (1.42 million metric tons), the total radioactivity (pCi) is:

Total activity = Concentration x Mass of Ash

Total activity = 2000 pCi/kg x 1,424,736,000 kg = 2,849,472,000,000 pCi

Converting activity to mass (using Ra-226 specific activity = 1 Ci/g = 3.7×10^{10} pCi/g):

Mass = 2,849,472,000,000 / 3.7×10^{10} pCi/g = 0.0770 kg

The total combined mass of Radium-226 and Radium-228 in the ash is approximately 0.0770 kg. This assumes the entire 2 pCi/g is due to Ra-226 or an average radionuclide with similar specific activity. If Ra-228, with a much shorter half-life, were dominant, the mass would be even smaller.

Dallman Ash Pond - Porewater Results – Radium 226 and 228 combined

Method	Units	Date	D1	D2	D3	D4	Min	Max	Avg
9320	pci/L	4/29/24	< 1.43	6.81	< 2.5	< 3.34	1.43	6.81	3.52

The total mass of combined radium 226 and radium 228 in porewater is calculated using the total activity for the average combined concentration and the total activity:

Total activity = Concentration x Volume

Total activity = 3.52 pCi/L x 582,000,000 L = 2,048,640,000 pCi

For the maximum concentration (6.81 pCi/L) the total activity is:

Total activity = 6.81 pCi/L x 582,000,000 L = 3,963,420,000 pCi

Converting activity to mass (using Ra-226 equivalence):

Mass = 2,048,640,000 pCi / 3.7 x 1010 pCi/g = 0.0000554 kg

And for the maximum concentration:

Mass = 3,963,420,000 pCi / 3.7 x 10^{10} pCi/g = 0.000107 kg

The total combined mass of Radium-226 and Radium-228 in the ash is approximately 0.0000554 to 0.000107 kg. This assumes the specific activity of Ra-226; if Ra-228 dominates (which has a much higher specific activity due to its shorter half-life), the actual mass would be smaller.

Dallman Ash Pond - Results Comparison – Radium 226 and 228 combined

Parameter	SPLP	Porewater
Average Radium 226 and 228 combined Concentration	2 pCi/g	3.52 pCi/L
Total Radium 226 and 228 combined Mass	0.0770 kg	0.0000554 kg

The concentrations of radium 226 and 228 combined, in the SPLP and porewater samples are given in different units (pCi/kg and pCi/L, respectively). The total radium 226 and 228 combined mass in porewater is 0.0000554 kg, is significantly less than the SPLP-derived estimate (0.0770 kg).

The observed discrepancy in the total mass of radium-226 (Ra-226) and radium-228 (Ra-228) between the coal combustion residual (CCR) solids (fly ash and bottom ash) and the associated porewater reflects important geochemical and risk-based differences. These differences are

influenced by the mobility of radium in CCR environments and have direct implications for human health risk assessments. Solids Analysis (SW-846 Methods 9315 & 9320) shows significantly higher total mass of Ra-226 and Ra-228. Porewater Analysis (EPA Methods 903.0 & 904.0) shows much lower total radium mass. Based upon the evaluation, approximately 99% of total radium mass is retained in the solid phase.

The likely causes of the discrepancy include factors which limit radium mobility such as sorption and incorporation into solid matrix. Radium strongly adsorbs to iron and manganese oxides, aluminosilicates, and other mineral phases present in fly ash and bottom ash. In some cases, radium may be co-precipitated or structurally incorporated into solid phases (e.g., barium sulfate or carbonate minerals).

The geochemical conditions of CCR porewater that may contribute to this discrepancy include high pH typical of CCR porewater (>8.5–11). High pH promotes low radium solubility due to formation of insoluble hydroxides or competition with Ca^{2+}, Ba^{2+}, and Sr^{2+} for exchange sites. Also, the redox environment and the absence of strong complexing agents also reduce Ra mobility.

Low partitioning to aqueous phase may also contribute to the discrepancy. The distribution coefficient (Kd) for radium in CCR environments is often high, meaning only a small fraction partitions to water.

Therefore, despite high solid-phase concentrations, porewater concentrations may remain low unless geochemical conditions shift.

Porewater concentrations are more representative of risk. Human exposure risk from CCR sites (particularly for groundwater users) is generally driven by dissolved-phase transport of contaminants—what can leach and migrate into drinking water supplies.

The solid-phase inventory is useful for understanding the long-term potential for release (i.e., source strength), but does not represent an immediate risk unless radium becomes mobilized.

The large mass of Ra-226 and Ra-228 in CCR solids demonstrates a substantial source term, but the very low porewater concentrations indicate limited current mobility under site conditions. From a risk assessment perspective, porewater concentrations are the more relevant and protective measure of human health risk, particularly for groundwater contamination pathways.

Lakeside Ash Pond – Results – Radium 226 and 228 combined

Method	Units	L1 14.5-21.5	L1 24.5-31.5	L3 19.5-21.5	L3 29.5-32.7	L4 10-15.3	L5 19.5-21.5	L5 32.5-35.2	Min	Max	Avg
SPLP	pCi/g	< 2	< 2	< 2	< 2	< 2	< 3.31	< 3.55	2	3.55	2.41

Given a radium-226 and radium-228 combined average concentration of 2.41 pCi/g (in ash), and a total ash mass of 430,324,128 kg (0.430 million metric tons), the total radioactivity (pCi) is:

Total activity = 2,410 pCi/kg x 430,324,128 kg = 1,037,081,148,000 pCi

For the maximum combined radium 226 and radium 228 concentration (3.55 pCi/kg), the total activity is:

Total activity = 3,550 pCi/kg x 430,324,128 kg = 1,527,650,654,000 pCi

The mass calculation assumes an average effective specific activity for radium-226:

Mass = 1,037,081,148,000 pCi / 3.7 x 10^{10} pCi/g = 0.0280 kg

And for the maximum combined radium-226 and radium-228 concentration (3.55 pCi/kg), the mass is:

Mass = 1,527,650,654,000 pCi / 3.7 x 10^{10} pCi/g = 0.0413 kg

The total combined mass of Radium-226 and Radium-228 in the ash is approximately 0.0280 kg to 0.0413 kg. This assumes the entire combined mass of radium-226 and radium-228 is due to Ra-226 or an average radionuclide with similar specific activity. If Ra-228, with a much shorter half-life, were dominant, the mass would be even smaller.

Lakeside Ash Pond - Porewater Results – Radium 226 and 228 combined

Method	Units	Date	L1	L3	L4	L5	Min	Max	Avg
Porewater	pci/L	4/29/24	< 1.25	2.5	1.05	17.7	1.05	17.7	5.64

The total mass of combined radium 226 and radium 228 in porewater is calculated using the total activity for the average combined concentration and the total activity:

Total activity = 5.64 pCi/L x 351,572,000 L = 1,982,866,080 pCi

For the maximum combined radium 226 and radium 228 concentration (17.7 pCi/L), the total activity is:

Total activity = 17.7 pCi/L x 351,572,000 L = 6,222,824,400 pCi

Since the activity is combined, the combined mass is calculated assuming an average effective specific activity for radium-226:

Mass = 1,982,866,080 pCi / 3.7 x 1010 pCi/g = 0.0000536 kg

And for the maximum combined radium-226 and radium-228 concentration, the mass is:

Mass = 6,222,824,400 pCi / 3.7 x 10^{10} pCi/g = 0.000168 kg

The total combined mass of Radium-226 and Radium-228 in the ash is approximately 0.0000536 kg to 0.000168 kg. This assumes the specific activity of Ra-226; if Ra-228 dominates (which has a much higher specific activity due to its shorter half-life), the actual mass would be smaller.

Lakeside Ash Pond - Results Comparison – Radium 226 and 228 combined

Parameter	SPLP	Porewater
Average Radium 226 and 228 combined Concentration	2.41 pCi/kg	5.64 pCi/L
Total Radium 226 and 228 combined Mass	0.0280 kg	0.0000536 kg

The concentrations of radium 226 and 228 combined, in the solids and porewater analytical results are given in different units (pCi/kg and pCi/L, respectively) and cannot be directly compared. The total radium 226 and 228 combined mass in porewater is 0.0000536-0.000168 kg, and significantly less than that calculated for the solids derived estimate (0.0280-0.0413 kg). See discussion above.

7. MASS OF ARSENIC AND COBALT IN THE BASAL SAND PLUME

The quantity of total arsenic and total cobalt in the basal sand plume is calculated as the dissolved mass within the specified plume area where concentrations exceed the groundwater protection standard (total arsenic = 0.0239 mg/L and total cobalt = 0.006 mg/L). This uses the following formula for dissolved contaminants in groundwater:

Mass (M) = Plume area (A) x Aquifer thickness (b) x Total Porosity (n) x Average plume concentration (C)

Given:

Plume area (A) = area of the plume where concentrations exceed the groundwater protection standard; 8 consecutive quarters of groundwater analytical data was collated for the parameters total arsenic and total cobalt (see Table 2 and Table 3, respectively). This data was used to calculate the averages for total arsenic and total cobalt concentrations. The average values were

used to generate plume maps for total arsenic and total cobalt (See Figure 3 and Figure 4, respectively). Using the design and geological data, the areas of each plume were determined;

- for total arsenic > 0.0239 mg/L = 241,780 ft² = 22,462 m² (see Figure 3);
- for total cobalt > 0.006 mg/L = 192,776 ft² = 17,909 m² (see Figure 4).

Aquifer thickness (b) = 4.3 feet or 1.31 m; (average based on basal sand range of 0–16.9 feet from site data; an average values is assumed as a conservative estimate for the plume-bearing zone, as the unit is not consistent but is the primary migration pathway).

Total Porosity (n) = 0.437; for the basal sand, the total porosity is based on the saturation water content of sand (0.437)(Rawls et al., 1982).

Average plume concentration (C) = Average concentration of contaminant of concern within the plume area;

- for total arsenic = 0.136 mg/L = 0.136 g/m³ (see Figure 3); Average of values at wells AP8 (0.0426 mg/L) and well RW3 (0.229 mg/L) within arsenic plume area
- for total cobalt = 0.00801 mg/L = 0.00801 g/m³ (see Figure 4); Average of values at wells AP2A (0.00976 mg/L) and AP3 (0.00626 mg/L) within cobalt plume area.

Total Arsenic Mass

Pore volume = A × b × n = 22,462 m² × 1.31 m × 0.437 = 12,859 m³

Total mass = 12,859 m³ × 0.136 g/m³ = 1746 g = 1.746 kg

For the excess mass above the standard (using C_{excess} = 0.136 – 0.0239 = 0.112 mg/L = 0.112 g/m³):

Excess mass = 12,859 m³ × 0.112 g/m³ = 1,439 g = 1.439 kg

Using the average concentration, the approximate mass of total arsenic in the plume area that exceeds the groundwater protection standard (0.0239 mg/L) is 1.439 kg.

Total Cobalt Mass

Pore volume = A × b × n = 17,909 m² × 1.31 m × 0.437 = 10,253 m³

Total mass = 10,253 m³ × 0.00801 g/m³ = 82 g = 0.082 kg

For the excess mass above the standard (using C_{excess} = 0.00801 - 0.006 = 0.002 mg/L = 0.002 g/m³):

Excess mass = 17,909 m³ × 0.002 g/m³ = 21 g = 0.021 kg.

Using the average concentration, the approximate mass of total cobalt in the plume area that exceeds the groundwater protection standard (0.006 mg/L) is 0.021 kg.

8. CONCLUSIONS

Based upon an evaluation of the analytical data from the review period (first quarter 2022 through fourth quarter 2024) there were exceedances of the groundwater protection standards for arsenic at wells AW-1, RW-3, AP-7, and AP-8 and cobalt at wells AP-2A and AP-3. While the source of the arsenic and cobalt exceedances at wells adjacent to the CCR surface impoundments is likely due to leaching of the CCR, the spatial distribution of the impacts at wells north and west of Sugar Creek indicates the source is more likely attributed to other natural and/or anthropogenic sources.

The nature and extent of arsenic exceedances along the north side of the Dallman Ash Pond at wells AW-1, RW-3, AP-7, and AP-8 have been characterized. Advection appears to be the primary transport mechanism due to sustained groundwater flow, while diffusion is negligible because large, dilute plumes generate weak concentration gradients. At well AW-1, the limits of arsenic exceedances are delineated by the arsenic concentrations at G120, P06D, and R111. The arsenic exceedances at RW-3 are delineated by well AP-6. At well AP-7, the arsenic exceedances appear to be the result of natural spatial variability or influences from other sources north of the impoundments. Bedrock contours and potentiometric surface data indicate groundwater converges on Sugar Creek with groundwater flow to the south, north of Sugar Creek and groundwater flow to the north, south of Sugar Creek. At well AP-8 the nature and extent of the arsenic exceedances are defined by well T-4. The wells (i.e., T-4, T-5, T-6, and AP-7) utilized in the evaluation of arsenic are all north of Sugar Creek, Wells AP-6 and RW-3 are located south of Sugar Creek.

Along the west side of the Dallman Ash Pond, the nature and extent of the cobalt exceedances at AP-2A and AP-3 are characterized by the cobalt concentrations at wells located west of Sugar Creek (i.e., AP-11, AP-12, and T-2). The cobalt exceedances at wells AP-2A and AP-3 may be related to the CCR surface impoundments; however, the concentrations of cobalt at wells AP-11, AP-12, and T-2 appears to be related to natural spatial variability or influences from other sources west of the impoundments. Bedrock contours and potentiometric surface data indicate groundwater converges on Sugar Creek with groundwater flow to the east, west of Sugar Creek and groundwater flow to the west, east of Sugar Creek.

Evaluation of porewater and synthetic precipitation leaching procedure (SPLP) analytical results provides important insight into the environmental mobility of arsenic and cobalt in the ash ponds. In the Dallman Ash Pond, the average arsenic concentration in porewater (0.124 mg/L) is approximately 84% higher than the SPLP concentration (0.0194 mg/L). Correspondingly, the estimated total arsenic mass in porewater (72.2–99.5 kg) is substantially greater than SPLP-derived estimates (11.3–27.4 kg). In the Lakeside Ash Pond, the average arsenic concentration in porewater (0.137 mg/L) is approximately 87% higher than in SPLP samples (0.0172 mg/L), and the estimated arsenic mass in porewater (48.2–159 kg) similarly exceeds SPLP-derived estimates (6.05–11.6 kg). These findings suggest that site-specific porewater conditions—characterized by elevated pH and potentially reducing environments—enhance arsenic solubility and mobility, conditions not replicated under SPLP's acidic leaching environment. As a result, SPLP may under predict the mass and leachability of arsenic from CCR under field-relevant conditions.

In the Dallman Ash Pond, the average porewater cobalt concentrations (0.00425 mg/L) are about 29% lower than SPLP results (0.006 mg/L), yielding comparable mass estimates (2.47–3.61 kg for porewater vs. 3.49 kg SPLP-derived). In the Lakeside Ash Pond, porewater cobalt concentrations (0.0086 mg/L) are approximately 30% higher than SPLP concentrations (0.006 mg/L), with estimated mass in porewater (3.02–6.82 kg) slightly exceeding SPLP-derived estimates (2.11 kg). The modest but notable differences between porewater and SPLP cobalt data highlight some influence of site geochemical conditions, though cobalt appears to be less sensitive to pH-driven mobilization than arsenic.

Taken together, the significantly higher arsenic concentrations and mass estimates in CCR porewater compared to SPLP data indicate that arsenic is mobilized under field conditions present within the ash ponds and that these conditions are not well captured by laboratory leaching tests. This supports the conclusion that arsenic observed in groundwater at wells adjacent to the impoundments is likely at least partially attributable to leaching from CCR materials.

In contrast, cobalt exhibits smaller differences between porewater and SPLP results, suggesting that while leaching may occur, it may be less dependent on the site-specific geochemical conditions. Nonetheless, given the presence of statistically significant exceedances near the impoundments and measurable cobalt mass in porewater, CCR leaching remains a plausible source for observed cobalt concentrations in groundwater near the ash ponds.

Accordingly, the combined assessment of groundwater exceedances, hydrogeologic conditions, and constituent leaching behavior supports the conclusion that leachate originating from CCR units is a likely contributor to the observed arsenic and cobalt concentrations in certain downgradient wells. The quantities of total arsenic (~1.44 kg excess) and total cobalt (~0.021 kg excess) released from the Dallman and Lakeside Ash Ponds into the basal sand are small relative to leachable masses in the impoundments (~63-130 kg arsenic; ~4.7 kg cobalt), reflecting effective containment by low-permeability cohesive deposits and semi-confined conditions.

Releases are limited to localized plumes in the basal sand, driven by downward gradients but attenuated by adsorption and low hydraulic conductivities. No releases to the shallow sand occur due to its discontinuity, vertical separation, and lack of pathways. Overall, the site hydrogeology minimizes off-site migration, with radium and other constituents similarly retained; ongoing monitoring and closure activities (e.g., dewatering) will further reduce risks by eliminating hydraulic heads. Continued assessment monitoring and corrective measures evaluation under 40 CFR § 257.95 are warranted to ensure protection of groundwater resources and inform closure strategy implementation.

The assessment of corrective measures per 40 CFR 257.95(g)(1) for the Appendix IV constituents identified as exhibiting Statistically Significant Levels (SSLs) identified in the February 13, 2025 Groundwater Protection Standards Report (GWPS Report) has been completed. The nature and extent of the Appendix IV exceedances are not expected to affect the proposed closure of the CCR surface impoundments (i.e., the selected remedy).

This report has provided a discussion of relevant site conditions necessary to characterize the nature and extent of the Appendix IV exceedances and any conditions that may affect the proposed closure of the CCR surface impoundments. Characterization of the release includes:

- A groundwater monitoring well network that adequately characterizes groundwater flow and the Appendix IV exceedances; and,
- A summary of analytical results for Appendix IV constituents and comparison to the established groundwater protection standards.

Assessment monitoring shall continue as specified in the Groundwater Monitoring Program.

9. ENGINEERING CERTIFICATION

The owner or operator of a coal combustion residual unit must obtain a certification from a qualified professional engineer that the Nature and Extent Report has been completed pursuant to 40 C.F.R. § 257.95(g)(3)(ii) and Paragraphs 268 and 270 of the Consent Agreement and Final Order.

The engineering certification for the groundwater monitoring system follows.

QUALIFIED PROFESSIONAL ENGINEER CERTIFICATION

I, Karl W. Finke, a qualified professional engineer in good standing in the State of Illinois, certify that the information in this report is presented pursuant to 40 CFR 257.95(g)(3)(ii) and Paragraphs 268 and 270 of the Consent Agreement and Final Order, is accurate as of the date of my signature below. The content of this report is not to be used for other than for its intended purpose and meaning, or for extrapolations beyond the interpretations contained herein.

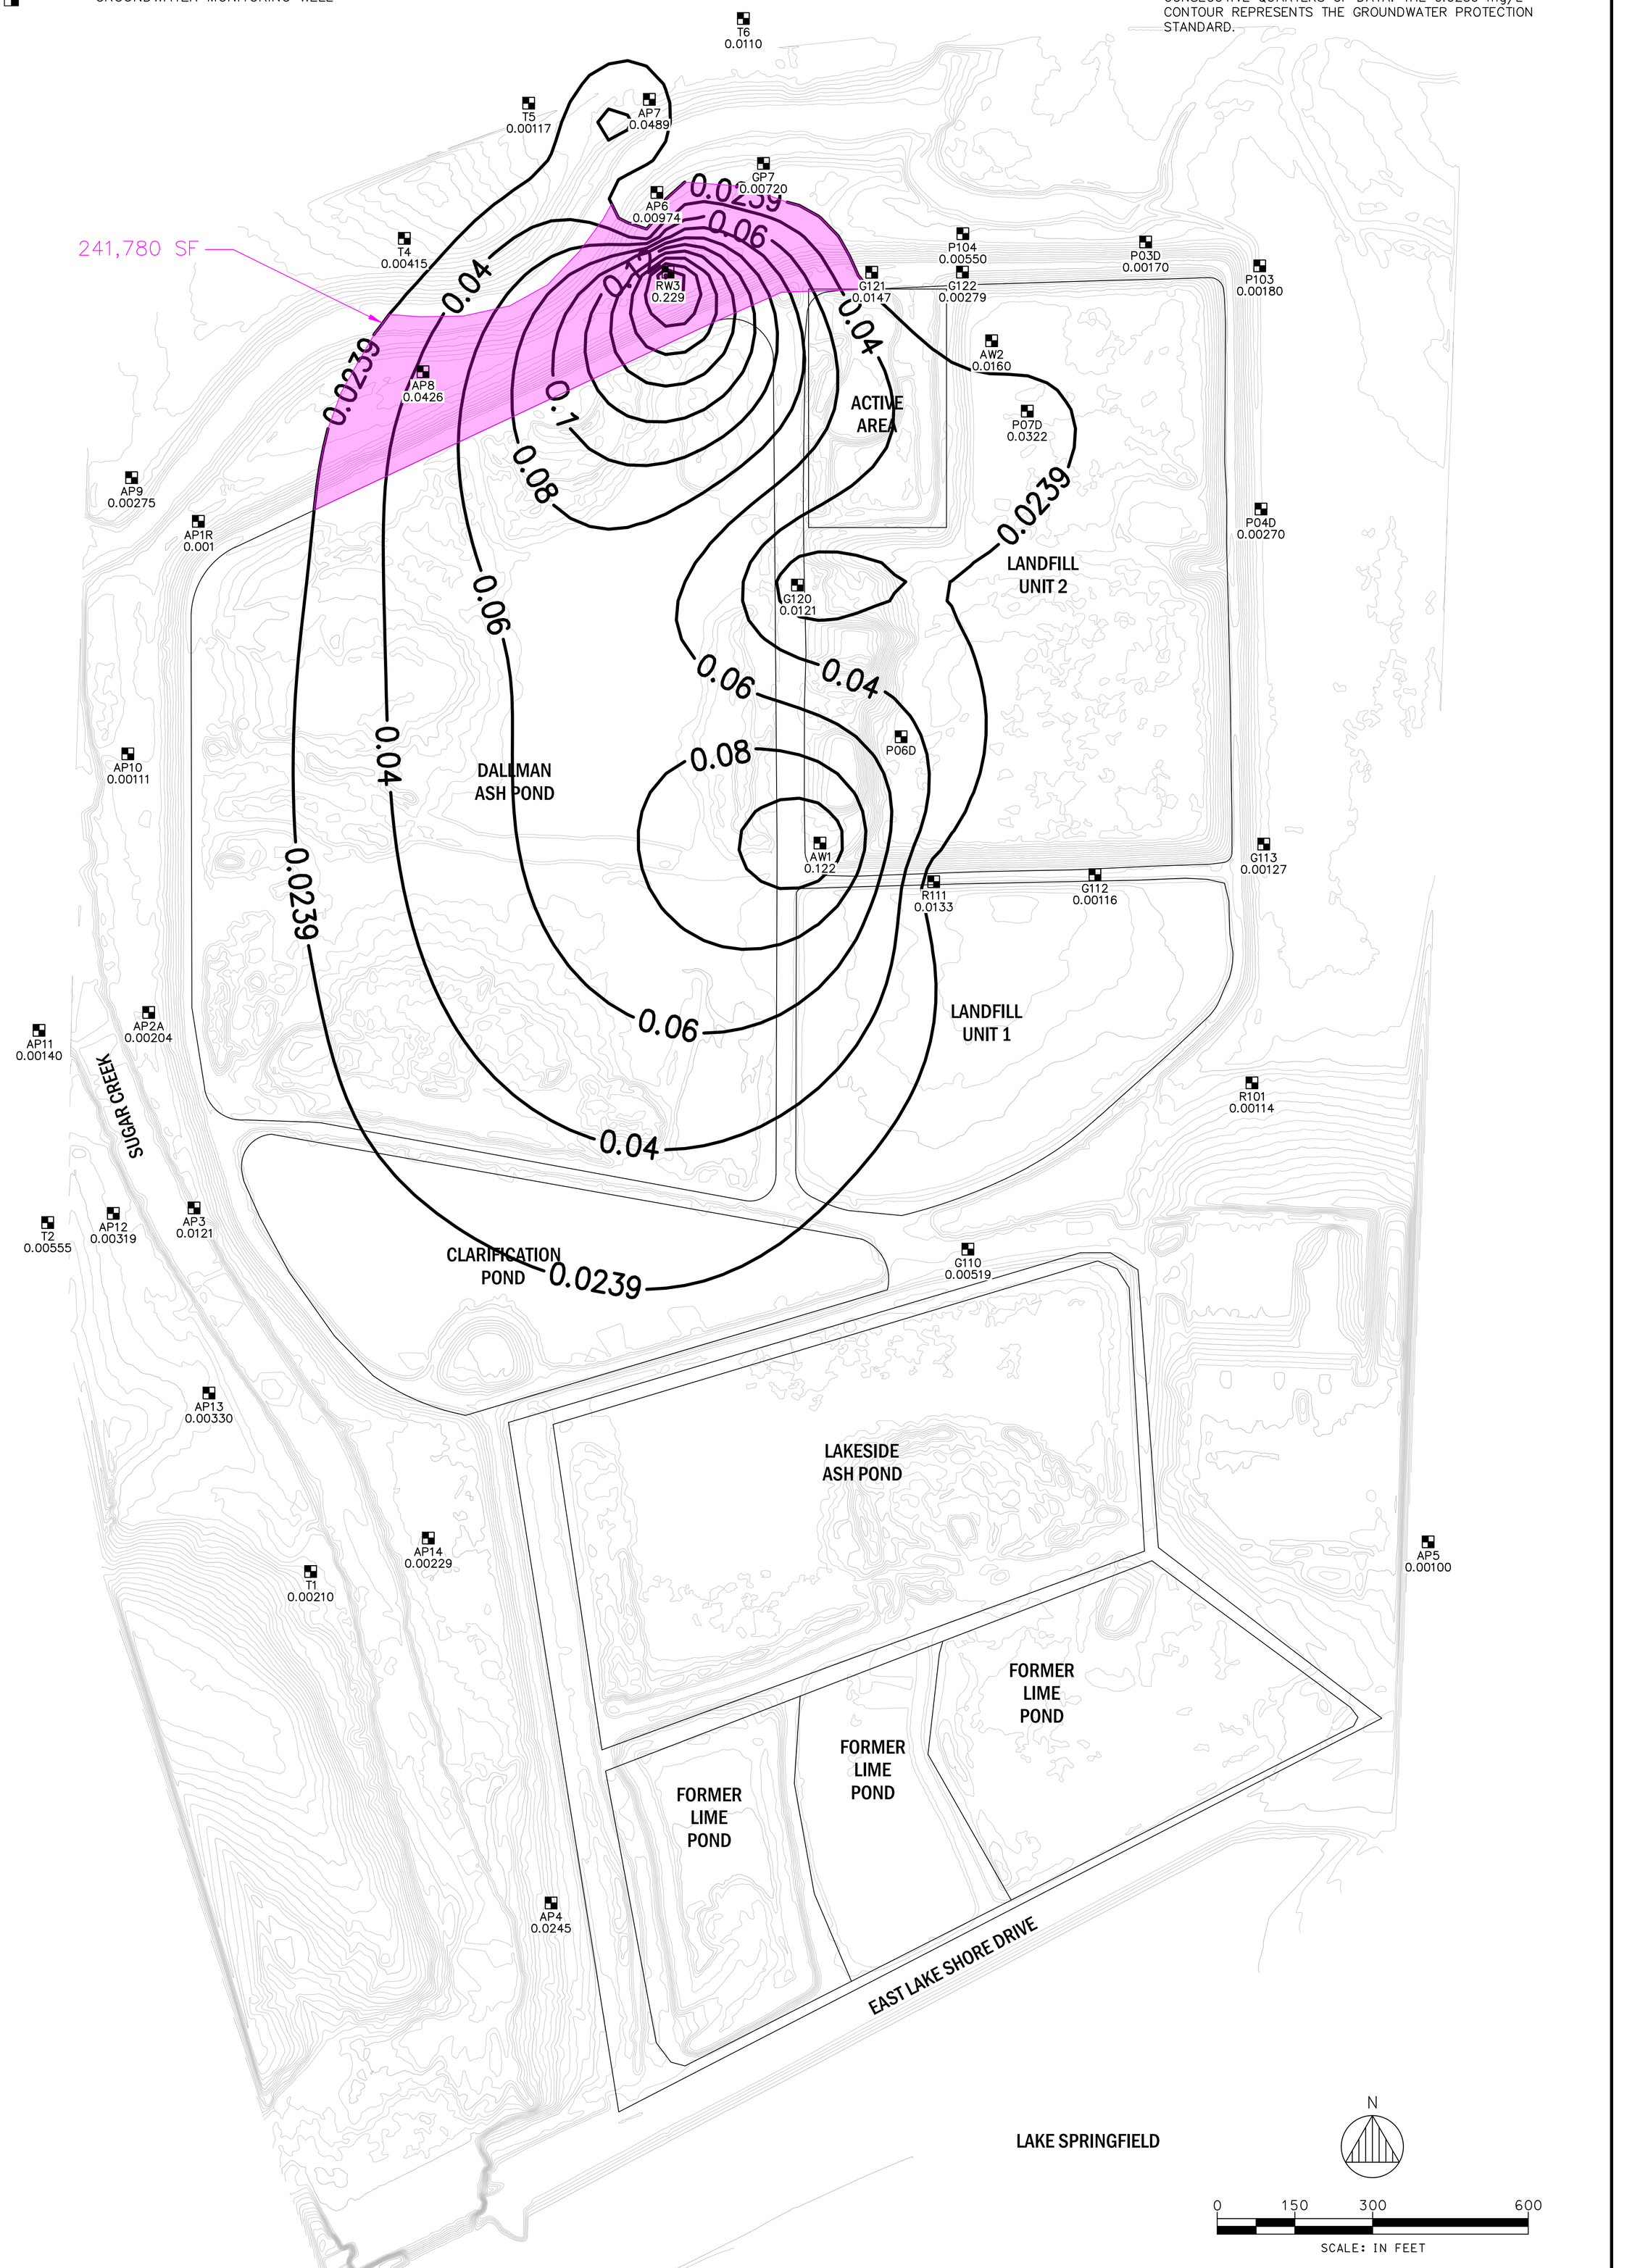
Extent of Total Arsenic Exceedances

LEGEND



550 — EXISTING GROUND CONTOURS

100 — ARSENIC TOTAL CONTOURS (mg/L)

GROUNDWATER MONITORING WELL

NOTES

1. FLIGHT DATE APRIL 2023.
2. PLUME CONTOUR INTERVAL SHOWN IS 0.02 mg/L.
3. ARSENIC TOTAL PLUME BASED ON AVERAGE OF 8 CONSECUTIVE QUARTERS OF DATA. THE 0.0239 mg/L CONTOUR REPRESENTS THE GROUNDWATER PROTECTION STANDARD.

NOTES

1. DEPTH AND THICKNESS OF SUBSURFACE STRATA WERE GENERALIZED FROM AND INTERPOLATED BETWEEN BORINGS. INFORMATION ON ACTUAL SUBSURFACE CONDITIONS EXISTS ONLY AT THE LOCATION OF THE BORING. SEE BORING LOGS FOR DETAILED DESCRIPTION.
2. SURFACE GENERATED FROM LIDAR DATA DERIVED FROM USGS WEBSITE (FLIGHT DATE: MAY 16, 2023).
3. WELL/BORING SYMBOL PLACED AT SURFACE ELEVATION AT THE TIME THE BORING WAS COMPLETED.

RE: CWLP Borings **WorkOrder:** 24050235

Dear Eric Staley:

TEKLAB, INC received 4 samples on 5/2/2024 1:11:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

Report Contents

Client: City Water, Light & Power
Client Project: CWLP Borings

Work Order: 24050235
Report Date: 28-May-24

This reporting package includes the following:

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	6
Laboratory Results	7
Receiving Check List	11
Chain of Custody	Appended

Client: City Water, Light & Power **Work Order:** 24050235

Client Project: CWLP Borings **Report Date:** 28-May-24

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 24050235

Client Project: CWLP Borings
Report Date: 28-May-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: 24050235

Dear Shelly Hennessy:

Order No.: 24050488

Summit Environmental Technologies, Inc. received 3 sample(s) on 5/7/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24050488**
Date: **5/23/2024**

CLIENT: TEKLAB Inc,
Project: 24050235

WorkOrder Narrative:
24050488: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **24050488**
Date: **5/23/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

RE: CWLP Borings **WorkOrder:** 24050346

Dear Eric Staley:

TEKLAB, INC received 10 samples on 5/3/2024 1:50:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 24050346

Client Project: CWLP Borings
Report Date: 05-Jun-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: 24050346

Dear Shelly Hennessy:

Order No.: 24050783

Summit Environmental Technologies, Inc. received 10 sample(s) on 5/9/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24050783**
Date: **6/5/2024**

CLIENT: TEKLAB Inc,
Project: 24050346

WorkOrder Narrative:
24050783: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **24050783**
Date: **6/5/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: CWLP Borings **WorkOrder:** 24050428

Dear Eric Staley:

TEKLAB, INC received 2 samples on 5/6/2024 12:00:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Definitions

Client: City Water, Light & Power
Work Order: 24050428
Client Project: CWLP Borings
Report Date: 28-May-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: 24050428

Dear Shelly Hennessy:

Order No.: 24050795

Summit Environmental Technologies, Inc. received 2 sample(s) on 5/9/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24050795**
Date: **5/28/2024**

CLIENT: TEKLAB Inc,
Project: 24050428

WorkOrder Narrative:
24050795: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **24050795**
Date: **5/28/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

RE: CWLP Borings **WorkOrder:** 24050236

Dear Eric Staley:

TEKLAB, INC received 4 samples on 5/2/2024 1:11:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: 24050236

Dear Shelly Hennessy:

Order No.: 24050483

Summit Environmental Technologies, Inc. received 4 sample(s) on 5/6/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24050483**
Date: **5/22/2024**

CLIENT: TEKLAB Inc,
Project: 24050236

WorkOrder Narrative:
24050483: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Sample Fraction:
Per Chain of Custody note: Analyze Aqueous layer only.

Qualifiers and Acronyms

WO#: **24050483**
Date: **5/22/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: CWLP Borings **WorkOrder:** 24050347

Dear Eric Staley:

TEKLAB, INC received 3 samples on 5/3/2024 1:50:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Definitions

Client: City Water, Light & Power
Work Order: 24050347
Client Project: CWLP Borings
Report Date: 23-May-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: 24050347

Dear Shelly Hennessy:

Order No.: 24050485

Summit Environmental Technologies, Inc. received 3 sample(s) on 5/7/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24050485**
Date: **5/22/2024**

CLIENT: TEKLAB Inc,
Project: 24050347

WorkOrder Narrative:
24050485: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence QC Notes:
LCS/LCSD-75217 Radium-228_DW(904.0): LCS and LCSD exhibited a high RPD, individually each LCS/LCSD meets the required criteria.

Qualifiers and Acronyms

WO#: **24050485**
Date: **5/22/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

RE: CWLP Borings **WorkOrder:** 24050429

Dear Eric Staley:

TEKLAB, INC received 1 sample on 5/6/2024 12:00:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	6
Laboratory Results	7
Receiving Check List	8
Chain of Custody	Appended

Client: City Water, Light & Power **Work Order:** 24050429

Client Project: CWLP Borings **Report Date:** 18-Jun-24

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Dear Shelly Hennessy:

Order No.: 24050786

Summit Environmental Technologies, Inc. received 1 sample(s) on 5/9/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

WorkOrder Narrative:
24050786: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **24050786**
Date: **6/18/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

Comments: **Please Issue reports and invoices via email only**
Please analyze for Radium 226/228 per your usual methods.
Any changes to analysis/methods must be approved by Teklab, Inc. Batch QC is required.
Samples collected from an IL site.

Contact: Shelly Hennessy Email: shennessy@TekLabInc.com
Requested Due Date: Standard TAT Billing/PO: 36235 Phone: (618) 344-1004 ext. 36

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

RE: CWLP Borings **WorkOrder:** 24050235

Dear Eric Staley:

TEKLAB, INC received 4 samples on 5/2/2024 1:11:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

RE: Ash Pond Monitoring Wells **WorkOrder:** 22011434

Dear Eric Staley:

TEKLAB, INC received 15 samples on 2/17/2022 6:23:00 AM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

Client Project: Ash Pond Monitoring Wells

Work Order: 22011434
Report Date: 16-Mar-22

This reporting package includes the following:

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	6
Laboratory Results	7
Receiving Check List	22
Chain of Custody	Appended

Client: City Water, Light & Power **Work Order:** 22011434

Client Project: Ash Pond Monitoring Wells **Report Date:** 16-Mar-22

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 22011434

Client Project: Ash Pond Monitoring Wells
Report Date: 16-Mar-22

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Case Narrative

http://www.teklabinc.com/

Client: City Water, Light & Power
Work Order: 22011434
Client Project: Ash Pond Monitoring Wells
Report Date: 16-Mar-22

Cooler Receipt Temp: 2.8 °C

An employee of Teklab, Inc. collected the sample(s). AP-10 could not be collected; the sampling point was frozen.

Radium-226 and Radium-228 analysis was performed by Summit Environmental Technologies, Inc. See attached report for results.

RE: 22011434

Dear Shelly Hennessy:

Order No.: 22021386

Summit Environmental Technologies, Inc. received 14 sample(s) on 2/21/2022 for the analyses presented in the following report.

Jennifer Woolf

Project Manager

3310 Win St.

Case Narrative

WO#: **22021386**
Date: **3/9/2022**

CLIENT: TEKLAB Inc,
Project: 22011434

WorkOrder Narrative:
22021386: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Sample Notes:
22011434-014: One sample matrix is clear, the other sample has a "dirty" appearance through the bottle . The ID numbers on the the bottles both indicate 22011434-014B and both lids indicate "AP-13". Composite both bottles per client.

Summit Environmental Technologies, In

Qualifiers and Acronyms

WO#: **22021386**
Date: **3/9/2022**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: Landfill Monitoring Wells **WorkOrder:** 22011433

Dear Eric Staley:

TEKLAB, INC received 12 samples on 2/17/2022 11:26:00 AM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

RE: Ash Pond Monitoring Wells **WorkOrder:** 22051753

Dear Eric Staley:

TEKLAB, INC received 15 samples on 6/2/2022 7:33:00 AM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

RE: 22051753

Dear Shelly Hennessy:

Order No.: 22060560

Summit Environmental Technologies, Inc. received 15 sample(s) on 6/8/2022 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **22060560**
Date: **7/12/2022**

CLIENT: TEKLAB Inc,
Project: 22051753

WorkOrder Narrative:
22060560: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Run Comments:
145867: 22060887-001A is 22060877-001a in attached spreadsheet

Analytical Sequence Sample Notes:
22060560-013A Radium-228_NPW(904.0): Sample and Sample Duplicate exhibited high RPD for Radium-228 due to possible sample matrix interference.

Qualifiers and Acronyms

WO#: **22060560**
Date: **7/12/2022**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: Landfill Monitoring Wells G1-G2-G3 **WorkOrder:** 22051752

Dear Eric Staley:

TEKLAB, INC received 12 samples on 6/3/2022 7:42:00 AM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power

Work Order: 22051752

Client Project: Landfill Monitoring Wells G1-G2-G3

Report Date: 17-Jun-22

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: Ash Pond Monitoring Wells **WorkOrder:** 22081061

Dear Eric Staley:

TEKLAB, INC received 15 samples on 8/26/2022 8:00:00 AM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 22081061

Client Project: Ash Pond Monitoring Wells
Report Date: 11-Oct-22

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: 22081061

Order No.: 22090086

Dear Shelly Hennessy:

Summit Environmental Technologies, Inc. received 15 sample(s) on 8/31/2022 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **22090086**
Date: **10/11/2022**

CLIENT: TEKLAB Inc,
Project: 22081061

WorkOrder Narrative:
22090086: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence Sample Notes:
22090086-001A Radium-228_NPW(904.0): Sample and Sample Duplicate exhibited high RPD for Radium-228 possibly due to sample matrix interference.
22090086-002A Radium-228_NPW(904.0): Sample and Sample Duplicate exhibited high RPD for Radium-228 possibly due to sample matrix interference.

Qualifiers and Acronyms

WO#: **22090086**
Date: **10/11/2022**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

Comments: **Please Issue reports and invoices via email only**
Please analyze for Radium (226 and 228) by method EPA903.0/904.0
on your standard turnaround time.
Batch QC is required with the report. Receipt summary requested. State of Origin: IL

Project# 22081061

Contact: Shelly A. Hennessy | Email: SHennessy@TekLabInc.com
Requested Due Date: 20 business days or less | Billing/PO: 33267 | Phone: (618) 344-1004

PLEASE NOTE

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

Any changes to analysis/methods must be approved by Teklab, Inc.

RE: Landfill Monitoring Wells **WorkOrder:** 22081060

Dear Eric Staley:

TEKLAB, INC received 12 samples on 8/25/2022 9:21:00 AM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Client Project: Landfill Monitoring Wells **Report Date:** 19-Sep-22

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 22081060

Client Project: Landfill Monitoring Wells
Report Date: 19-Sep-22

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: Ash Pond Monitoring Wells **WorkOrder:** 22110359

Dear Eric Staley:

TEKLAB, INC received 15 samples on 11/10/2022 8:20:00 AM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power

Work Order: 22110359

Client Project: Ash Pond Monitoring Wells

Report Date: 19-Dec-22

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Case Narrative

http://www.teklabinc.com/

Client: City Water, Light & Power
Client Project: Ash Pond Monitoring Wells

Work Order: 22110359
Report Date: 19-Dec-22

Cooler Receipt Temp: 4.8 °C

An employee of Teklab, Inc. collected the sample(s).

Radium-226 and Radium-228 analysis was performed by Pace Analytical National. See attached report for results.

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C 4.8
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice ☐
Chain of custody present?	Yes ☑	No ☐		
Chain of custody signed when relinquished and received?	Yes ☑	No ☐		
Chain of custody agrees with sample labels?	Yes ☑	No ☐		
Samples in proper container/bottle?	Yes ☑	No ☐		
Sample containers intact?	Yes ☑	No ☐		
Sufficient sample volume for indicated test?	Yes ☑	No ☐		
All samples received within holding time?	Yes ☑	No ☐		
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐		

When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.

Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑
Water - pH acceptable upon receipt?	Yes ☑	No ☐	NA ☐
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑

Any No responses must be detailed below or on the COC.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Mark W. Beasley
Project Manager

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDA	Minimum Detectable Activity.
Rec.	Recovery.
RER	Replicate Error Ratio.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(T)	Tracer - A radioisotope of known concentration added to a solution of chemically equivalent radioisotopes at a known concentration to assist in monitoring the yield of the chemical separation.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
U	Below Detectable Limits: Indicates that the analyte was not detected.

RE: Landfill Monitoring Wells **WorkOrder:** 22110358

Dear Eric Staley:

TEKLAB, INC received 12 samples on 11/10/2022 8:20:00 AM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Elizabeth A. Hurley

Elizabeth A. Hurley

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 22110358

Client Project: Landfill Monitoring Wells
Report Date: 28-Nov-22

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: Ash Pond Monitoring Wells **WorkOrder:** 23020985

Dear Eric Staley:

TEKLAB, INC received 7 samples on 2/17/2023 8:50:00 AM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 23020985

Client Project: Ash Pond Monitoring Wells
Report Date: 13-Mar-23

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: 23020985

Order No.: 23021632

Dear Shelly Hennessy:

Summit Environmental Technologies, Inc. received 7 sample(s) on 2/22/2023 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **23021632**
Date: **3/10/2023**

CLIENT: TEKLAB Inc,
Project: 23020985

WorkOrder Narrative:
23021632: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence Sample Notes:

Qualifiers and Acronyms

WO#: **23021632**
Date: **3/10/2023**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: Ash Pond Monitoring Wells **WorkOrder:** 23010325

Dear Eric Staley:

TEKLAB, INC received 15 samples on 1/30/2023 9:20:00 AM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Client Project: Ash Pond Monitoring Wells

Work Order: 23010325
Report Date: 07-Mar-23

Carrier: John Riley

Completed by: Lindsey Maddox
On: 30-Jan-23

Received By: ANC

Reviewed by: Shelly A. Hennessy
On: 30-Jan-23

Pages to follow: Chain of custody 2 Extra pages included 23

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C 0.0
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice ☐
Chain of custody present?	Yes ☑	No ☐		
Chain of custody signed when relinquished and received?	Yes ☑	No ☐		
Chain of custody agrees with sample labels?	Yes ☑	No ☐		
Samples in proper container/bottle?	Yes ☑	No ☐		
Sample containers intact?	Yes ☑	No ☐		
Sufficient sample volume for indicated test?	Yes ☑	No ☐		
All samples received within holding time?	Yes ☑	No ☐		
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐		

When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.

Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑
Water - pH acceptable upon receipt?	Yes ☐	No ☑	NA ☐
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑

Any No responses must be detailed below or on the COC.

pH strip #87147 TSM. - lmaddox - 1/30/2023 10:36:29 AM

Additional Nitric Acid (86511) was needed in the 2 liter containers of AP-1, AP-2, AP-3, AP-4(2 of 2) upon arrival at the laboratory. - lmaddox - 1/30/2023 10:36:48 AM

RE: 23010325

Order No.: 23020178

Dear Shelly Hennessy:

Summit Environmental Technologies, Inc. received 8 sample(s) on 2/2/2023 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **23020178**
Date: **2/22/2023**

CLIENT: TEKLAB Inc,
Project: 23010325

WorkOrder Narrative:
23020178: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence QC Notes:
LCSD-62679 Radium-226_DW(903.0): LCSD-62679 exhibited a high recovery and RPD, the batch is in control by LCS/QCS-62679

Qualifiers and Acronyms

WO#: **23020178**
Date: **2/22/2023**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: Landfill Monitoring Wells **WorkOrder:** 23010324

Dear Eric Staley:

TEKLAB, INC received 12 samples on 1/27/2023 8:00:00 AM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Work Order: 23010324
Report Date: 07-Mar-23

This reporting package includes the following:

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	6
Laboratory Results	7
Receiving Check List	19
Chain of Custody	Appended

Client: City Water, Light & Power **Work Order:** 23010324

Client Project: Landfill Monitoring Wells **Report Date:** 07-Mar-23

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

RE: Ash Pond Monitoring Wells **WorkOrder:** 23040094

Dear Eric Staley:

TEKLAB, INC received 15 samples on 4/17/2023 6:34:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C 7.8
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice ☐
Chain of custody present?	Yes ☑	No ☐		
Chain of custody signed when relinquished and received?	Yes ☑	No ☐		
Chain of custody agrees with sample labels?	Yes ☑	No ☐		
Samples in proper container/bottle?	Yes ☑	No ☐		
Sample containers intact?	Yes ☑	No ☐		
Sufficient sample volume for indicated test?	Yes ☑	No ☐		
All samples received within holding time?	Yes ☑	No ☐		
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐		
When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.				
Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑	
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑	
Water - pH acceptable upon receipt?	Yes ☐	No ☑	NA ☐	
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑	

Any No responses must be detailed below or on the COC.

RW-3 was received on 4/11/23 at 1745 (on ice 10.2C - LTG1). - EAH 4/13/23

pH strip #87147. - acolin - 4/12/2023 12:43:58 PM

AP-1, AP-2, AP-3, AP-6, AP-8, and AP-10 were received on 4/12/23 at 1755 (on ice 3.8C - LTG 1). - EAH 4/13/23

pH strip #88374. - CET/TMathis - 4/13/2023 7:45:17 AM

AP-4, AP-5, and AP-14 were received on 4/13/23 at 1510 (on ice 9.0C - LTG 1). - EAH 4/13/23

AP-7, AP-9, AP-11, AP-12 and AP-13 were received on 4/17/23 at 1634 (on ice 7.8C - LTG 5). - lmaddox 4/18/23

pH strip #88374. - CET/lmaddox - 4/18/2023 9:26:13 AM

Additional Nitric Acid (89071) was needed in AP-11 upon arrival at the laboratory. - CET/lmaddox - 4/18/2023 9:26:50 AM

RE: 23040094

Order No.: 23041812

Dear Shelly Hennessy:

Summit Environmental Technologies, Inc. received 15 sample(s) on 4/26/2023 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Case Narrative

WO#: **23041812**
Date: **5/23/2023**

CLIENT: TEKLAB Inc,
Project: 23040094

WorkOrder Narrative:
23041812: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **23041812**
Date: **5/23/2023**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

Cooler Temp: | Sampler: Tracy Carroll/TEKLAB | QC Level: 2

Comments: **Please Issue reports and invoices via email only**
Please analyze for Radium 226/228 on your standard turn around time.
Samples collected from an IL site.
Batch QC is required for all analyses requested. EDD requested..

Project# 23040094

Contact: Shelly Hennessey | Email: shennessey@teklabinc.com
Requested Due Date: Standard TAT | Billing/PO: 34257 | Phone: (618) 344-1004

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

Any changes to analysis/methods must be approved by Teklab, Inc.

RE: Landfill Monitoring Wells G1-G2 **WorkOrder:** 23040093

Dear Eric Staley:

TEKLAB, INC received 12 samples on 4/12/2023 5:55:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Work Order: 23040093

Client Project: Landfill Monitoring Wells G1-G2

Report Date: 03-May-23

Qualifiers

- Unknown hydrocarbon

B - Analyte detected in associated Method Blank

C - RL shown is a Client Requested Quantitation Limit

E - Value above quantitation range

H - Holding times exceeded

I - Associated internal standard was outside method criteria

J - Analyte detected below quantitation limits

M - Manual Integration used to determine area response

ND - Not Detected at the Reporting Limit

R - RPD outside accepted recovery limits

S - Spike Recovery outside recovery limits

T - TIC(Tentatively identified compound)

X - Value exceeds Maximum Contaminant Level

RE: Ash Pond Monitoring Wells **WorkOrder:** 23070002

Dear Eric Staley:

TEKLAB, INC received 15 samples on 7/7/2023 4:44:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 23070002

Client Project: Ash Pond Monitoring Wells
Report Date: 16-Aug-23

Qualifiers

- Unknown hydrocarbon
B - Analyte detected in associated Method Blank
C - RL shown is a Client Requested Quantitation Limit
E - Value above quantitation range
H - Holding times exceeded
I - Associated internal standard was outside method criteria
J - Analyte detected below quantitation limits
M - Manual Integration used to determine area response
ND - Not Detected at the Reporting Limit
R - RPD outside accepted recovery limits
S - Spike Recovery outside recovery limits
T - TIC(Tentatively identified compound)
X - Value exceeds Maximum Contaminant Level

RE: 23070002

Dear Shelly Hennessy:

Order No.: 23070747

Summit Environmental Technologies, Inc. received 15 sample(s) on 7/12/2023 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **23070747**
Date: **8/15/2023**

CLIENT: TEKLAB Inc,
Project: 23070002

WorkOrder Narrative:
23070747: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **23070747**
Date: **8/15/2023**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: Landfill Monitoring Wells **WorkOrder:** 23070001

Dear Eric Staley:

TEKLAB, INC received 12 samples on 7/7/2023 4:44:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 23070001

Client Project: Landfill Monitoring Wells
Report Date: 03-Aug-23

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: Ash Pond Monitoring Wells **WorkOrder:** 23101164

Dear Eric Staley:

TEKLAB, INC received 15 samples on 10/25/2023 5:15:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

Report Contents

Client: City Water, Light & Power
Client Project: Ash Pond Monitoring Wells

Work Order: 23101164
Report Date: 27-Nov-23

This reporting package includes the following:

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	6
Laboratory Results	7
Receiving Check List	22
Chain of Custody	Appended

Client: City Water, Light & Power **Work Order:** 23101164

Client Project: Ash Pond Monitoring Wells **Report Date:** 27-Nov-23

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power

Work Order: 23101164

Client Project: Ash Pond Monitoring Wells

Report Date: 27-Nov-23

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Case Narrative

Client: City Water, Light & Power
Client Project: Ash Pond Monitoring Wells

Work Order: 23101164
Report Date: 27-Nov-23

Carrier: Justin Colp
Received By: HAW

Completed by: Timothy W. Mathis
On: 26-Oct-23

Reviewed by: Ellie Hopkins
On: 27-Oct-23

Pages to follow: Chain of custody 3 Extra pages included 57

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C	4.8	
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice	☐	
Chain of custody present?	Yes ☑	No ☐				
Chain of custody signed when relinquished and received?	Yes ☑	No ☐				
Chain of custody agrees with sample labels?	Yes ☑	No ☐				
Samples in proper container/bottle?	Yes ☑	No ☐				
Sample containers intact?	Yes ☑	No ☐				
Sufficient sample volume for indicated test?	Yes ☑	No ☐				
All samples received within holding time?	Yes ☑	No ☐				
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐			
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐				
When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.						
Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑			
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑			
Water - pH acceptable upon receipt?	Yes ☑	No ☐	NA ☐			
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑			

Any No responses must be detailed below or on the COC.

RE: 23101164

Dear Shelly Hennessy:

Order No.: 23110120

Summit Environmental Technologies, Inc. received 15 sample(s) on 11/1/2023 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **23110120**
Date: **11/22/2023**

CLIENT: TEKLAB Inc,
Project: 23101164

WorkOrder Narrative:
23110120: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **23110120**
Date: **11/22/2023**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: Landfill Monitoring Wells **WorkOrder:** 23101166

Dear Eric Staley:

TEKLAB, INC received 12 samples on 10/25/2023 5:15:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Report Date: 14-Nov-23

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: FGDS Landfill **WorkOrder:** 23101165

Dear Eric Staley:

TEKLAB, INC received 11 samples on 10/25/2023 5:15:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Client Project: FGDS Landfill **Report Date:** 30-Nov-23

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 23101165
Client Project: FGDS Landfill
Report Date: 30-Nov-23

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: 23101165

Dear Shelly Hennessy:

Order No.: 23110123

Summit Environmental Technologies, Inc. received 11 sample(s) on 11/1/2023 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **23110123**
Date: **11/28/2023**

CLIENT: TEKLAB Inc,
Project: 23101165

WorkOrder Narrative:
23110123: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **23110123**
Date: **11/28/2023**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: FGDS Landfill **WorkOrder:** 23101165

Dear Eric Staley:

TEKLAB, INC received 11 samples on 10/25/2023 5:15:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Client Project: FGDS Landfill **Report Date:** 30-Nov-23

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 23101165
Client Project: FGDS Landfill
Report Date: 30-Nov-23

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Case Narrative

Receiving Check List

http://www.teklabinc.com/

Client: City Water, Light & Power
Client Project: FGDS Landfill

Work Order: 23101165
Report Date: 30-Nov-23

Carrier: Justin Colp

Received By: HAW

Completed by: Timothy W. Mathis
On: 26-Oct-23

Reviewed by: Ellie Hopkins
On: 27-Oct-23

Pages to follow: Chain of custody 2 Extra pages included 45

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C 4.8
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice ☐
Chain of custody present?	Yes ☑	No ☐		
Chain of custody signed when relinquished and received?	Yes ☑	No ☐		
Chain of custody agrees with sample labels?	Yes ☑	No ☐		
Samples in proper container/bottle?	Yes ☑	No ☐		
Sample containers intact?	Yes ☑	No ☐		
Sufficient sample volume for indicated test?	Yes ☑	No ☐		
All samples received within holding time?	Yes ☑	No ☐		
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐		
When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.				
Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑	
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑	
Water - pH acceptable upon receipt?	Yes ☑	No ☐	NA ☐	
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑	

Any No responses must be detailed below or on the COC.

pH strip #90719 CET. - TMathis - 10/26/2023 12:50:41 PM

Additional Nitric Acid (92447) was needed in AW-2 250 and G120 2L upon arrival at the laboratory. - TMathis - 10/26/2023 12:55:07 PM

pH strip #90719. - amberdilallo - 10/27/2023 9:46:53 AM

Samples collected on 10/26/23 were delivered to the laboratory on 10/26/23 at 1707 (on ice - 2.4C - LTG1). - HW/ERH 10/27/23

RE: Ash Pond Monitoring Wells **WorkOrder:** 24010117

Dear Eric Staley:

TEKLAB, INC received 15 samples on 2/26/2024 6:45:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 24010117
Client Project: Ash Pond Monitoring Wells
Report Date: 18-Mar-24

Qualifiers

- Unknown hydrocarbon
B - Analyte detected in associated Method Blank
C - RL shown is a Client Requested Quantitation Limit
E - Value above quantitation range
H - Holding times exceeded
I - Associated internal standard was outside method criteria
J - Analyte detected below quantitation limits
M - Manual Integration used to determine area response
ND - Not Detected at the Reporting Limit
R - RPD outside accepted recovery limits
S - Spike Recovery outside recovery limits
T - TIC(Tentatively identified compound)
X - Value exceeds Maximum Contaminant Level

Receiving Check List

http://www.teklabinc.com/

Client: City Water, Light & Power
Client Project: Ash Pond Monitoring Wells

Work Order: 24010117
Report Date: 18-Mar-24

Carrier: Tracy Carroll

Received By: AMD

Completed by: Amber Dilallo
On: 22-Feb-24

Reviewed by: Ellie Hopkins
On: 27-Feb-24

Pages to follow: Chain of custody 6 Extra pages included 50

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C 3.3
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice ☐
Chain of custody present?	Yes ☑	No ☐		
Chain of custody signed when relinquished and received?	Yes ☑	No ☐		
Chain of custody agrees with sample labels?	Yes ☑	No ☐		
Samples in proper container/bottle?	Yes ☑	No ☐		
Sample containers intact?	Yes ☑	No ☐		
Sufficient sample volume for indicated test?	Yes ☑	No ☐		
All samples received within holding time?	Yes ☑	No ☐		
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐		
When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.				
Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑	
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑	
Water - pH acceptable upon receipt?	Yes ☑	No ☐	NA ☐	
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑	

Any No responses must be detailed below or on the COC.

pH strip #90719. - amberdilallo - 2/22/2024 8:40:42 AM

Samples were received on 2/22/24 at 15:40 on ice [7.3C - LTG5]. pH strip #90719. Collection date per Tracy Carroll. - amberdilallo - 2/22/2024 4:41:18 PM

Samples were received on 2/23/24 at 13:07 on ice [6.7C - LTG#7]. pH strip #90719. Additional Nitric Acid (96331) preservative was needed for AP-4 & AP-14 upon arrival at the laboratory. - nickreed - 2/23/2024 2:35:40 PM

Samples were received on 2/26/24 at 18:45 on ice [5.3c - LTG5]. pH strip #90719. - amberdilallo - 2/27/2024 8:11:24 AM

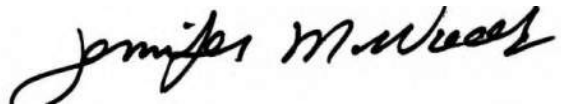
RE: 24010117

Order No.: 24030039

Dear Shelly Hennessy:



Summit Environmental Technologies, Inc. received 15 sample(s) on 2/29/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24030039**
Date: **3/15/2024**

CLIENT: TEKLAB Inc,
Project: 24010117

WorkOrder Narrative:
24030039: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **24030039**
Date: **3/15/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

Changes to analysis/methods must be approved by Teklab, Inc.

RE: FGDS Landfill **WorkOrder:** 24010118

Dear Eric Staley:

TEKLAB, INC received 11 samples on 2/1/2024 4:45:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Report Contents

Client: City Water, Light & Power
Work Order: 24010118
Client Project: FGDS Landfill
Report Date: 21-Feb-24

This reporting package includes the following:

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	6
Laboratory Results	7
Receiving Check List	13
Chain of Custody	Appended

Client: City Water, Light & Power **Work Order:** 24010118

Client Project: FGDS Landfill **Report Date:** 21-Feb-24

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 24010118
Client Project: FGDS Landfill
Report Date: 21-Feb-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Case Narrative

http://www.teklabinc.com/

Client: City Water, Light & Power
Client Project: FGDS Landfill

Work Order: 24010118
Report Date: 21-Feb-24

Cooler Receipt Temp: 8.5 °C

An employee of Teklab, Inc. collected the sample(s).

R101, G112, G113, AW-2 and RW-3 will be recollected at a later date.

Radium-226 and Radium-228 analysis was performed by Summit Environmental Technologies, Inc. See attached report for results.

Carrier: Tracy Carroll
Received By: AMD

Completed by: Amber Dilallo
On: 02-Feb-24

Reviewed by: Ellie Hopkins
On: 05-Feb-24

Pages to follow: Chain of custody 2 Extra pages included 29

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C 8.5
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice ☐
Chain of custody present?	Yes ☑	No ☐		
Chain of custody signed when relinquished and received?	Yes ☑	No ☐		
Chain of custody agrees with sample labels?	Yes ☑	No ☐		
Samples in proper container/bottle?	Yes ☑	No ☐		
Sample containers intact?	Yes ☑	No ☐		
Sufficient sample volume for indicated test?	Yes ☑	No ☐		
All samples received within holding time?	Yes ☑	No ☐		
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐		
When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.				
Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑	
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑	
Water - pH acceptable upon receipt?	Yes ☑	No ☐	NA ☐	
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑	

Any No responses must be detailed below or on the COC.

pH strip #90719. - amberdilallo - 2/2/2024 8:41:47 AM

RE: 24010118

Dear Shelly Hennessy:

Order No.: 24020447

Summit Environmental Technologies, Inc. received 6 sample(s) on 2/7/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24020447**
Date: **2/21/2024**

CLIENT: TEKLAB Inc,
Project: 24010118

WorkOrder Narrative:
24020447: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Qualifiers and Acronyms

WO#: **24020447**
Date: **2/21/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

Any changes to analysis/methods must be approved by Teklab, Inc.

RE: FGDS Landfill **WorkOrder:** 24020902

Dear Eric Staley:

TEKLAB, INC received 5 samples on 2/23/2024 1:07:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 24020902
Client Project: FGDS Landfill
Report Date: 21-Mar-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Client: City Water, Light & Power
Client Project: FGDS Landfill

Work Order: 24020902
Report Date: 21-Mar-24

Carrier: Tracy Carroll

Received By: AMD

Completed by: Amber Dilallo
On: 22-Feb-24

Reviewed by: Ellie Hopkins
On: 23-Feb-24

Pages to follow: Chain of custody 3 Extra pages included 33

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C	3.3	
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice	☐	
Chain of custody present?	Yes ☑	No ☐				
Chain of custody signed when relinquished and received?	Yes ☑	No ☐				
Chain of custody agrees with sample labels?	Yes ☑	No ☐				
Samples in proper container/bottle?	Yes ☑	No ☐				
Sample containers intact?	Yes ☑	No ☐				
Sufficient sample volume for indicated test?	Yes ☑	No ☐				
All samples received within holding time?	Yes ☑	No ☐				
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐			
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐				

When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.

Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑
Water - pH acceptable upon receipt?	Yes ☑	No ☐	NA ☐
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑

Any No responses must be detailed below or on the COC.

pH strip #90719. - amberdilallo - 2/22/2024 8:43:14 AM

Samples were received on 2/22/24 at 15:40 on ice [7.3C - LTG5]. pH strip #90719. - amberdilallo - 2/22/2024 4:38:19 PM

Samples were received on 2/23/24 at 13:07 on ice [6.7C - LTG#7]. pH strip #90719. Additional Nitric Acid (96331) was needed for R101 & G113 upon arrival at the laboratory. - nickreed - 2/23/2024 2:44:53 PM

RE: Ash Pond Monitoring Wells **WorkOrder:** 24050003

Dear Eric Staley:

TEKLAB, INC received 20 samples on 5/14/2024 2:39:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

Work Order: 24050003
Report Date: 15-Jul-24

This reporting package includes the following:

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	6
Laboratory Results	7
Receiving Check List	27
Chain of Custody	Appended

Client: City Water, Light & Power **Work Order:** 24050003

Client Project: Ash Pond Monitoring Wells **Report Date:** 15-Jul-24

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 24050003

Client Project: Ash Pond Monitoring Wells
Report Date: 15-Jul-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Case Narrative

Work Order: 24050003
Report Date: 15-Jul-24

Cooler Receipt Temp: 12.1 °C

This report was revised on July 15, 2024 per Eric Staley's request to report the reanalysis of Cobalt for AP-11. Please replace report dated June 18, 2024 with this report. SAH 7/15/24

An employee of Teklab, Inc. collected the sample(s).

Radium-226 & -228 analysis was performed by Summit Environmental Technologies, Inc. See attached report for results.

Locations

Collinsville

Address 5445 Horseshoe Lake Road
Collinsville, IL 62234-7425
Phone (618) 344-1004
Fax (618) 344-1005
Email jhriley@teklabinc.com

Springfield

Address 3920 Pintail Dr
Springfield, IL 62711-9415
Phone (217) 698-1004
Fax (217) 698-1005
Email KKlostermann@teklabinc.com

Kansas City

Address 8421 Nieman Road
Lenexa, KS 66214
Phone (913) 541-1998
Fax (913) 541-1998
Email jhriley@teklabinc.com

Collinsville Air

Address 5445 Horseshoe Lake Road
Collinsville, IL 62234-7425
Phone (618) 344-1004
Fax (618) 344-1005
Email EHurley@teklabinc.com

Chicago

Address 1319 Butterfield Rd.
Downers Grove, IL 60515
Phone (630) 324-6855
Fax
Email arenner@teklabinc.com

Client: City Water, Light & Power

Client Project: Ash Pond Monitoring Wells

Work Order: 24050003

Report Date: 15-Jul-24

Receiving Check List

http://www.teklabinc.com/

Client: City Water, Light & Power
Client Project: Ash Pond Monitoring Wells

Work Order: 24050003
Report Date: 15-Jul-24

Carrier: Daniel Crump
Received By: NR

Completed by: Paul Schultz
On: 10-May-24

Reviewed by: Ellie Hopkins
On: 14-May-24

Pages to follow: Chain of custody 6 Extra pages included 74

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C	12.1
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice	☐
Chain of custody present?	Yes ☑	No ☐			
Chain of custody signed when relinquished and received?	Yes ☑	No ☐			
Chain of custody agrees with sample labels?	Yes ☑	No ☐			
Samples in proper container/bottle?	Yes ☑	No ☐			
Sample containers intact?	Yes ☑	No ☐			
Sufficient sample volume for indicated test?	Yes ☑	No ☐			
All samples received within holding time?	Yes ☑	No ☐			
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐		
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐			

When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.

Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑
Water - pH acceptable upon receipt?	Yes ☐	No ☑	NA ☐
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑

Any No responses must be detailed below or on the COC.

pH strip #96651. - pschultz - 5/10/2024 9:15:35 AM
Additional Nitric Acid (97737) was needed for sample T-2 upon arrival at the laboratory. - pschultz - 5/10/2024 9:15:38 AM

Samples were received on 5/10/2024 at 13:30 on ice [8.3C - LTG#7]. pH strip #96651. WO - pschultz - 5/10/2024 2:41:25 PM

Samples were received on 5/13/2024 at 16:10 on ice [19.3C - LTG#7]. pH strip #96651. NR - pschultz - 5/13/2024 4:45:02 PM
Additional Nitric Acid (97737) was needed for AR-10 upon arrival at the laboratory. NR - pschultz - 5/13/2024 4:45:05 PM

Samples were received on 5/14/2024 at 14:39 on ice [8.1C - LTG#7]. pH strip #96651. NR - pschultz - 5/14/2024 3:02:50 PM

CHAIN OF CUSTODY

Pg 2 of 2 Workorder # 24050003

TEKLAB INC, 5445 Horseshoe Lake Road, Collinsville, IL 62234 Phone (618) 344-1004 Fax (618) 344-1005

Client: City Water, Light & Power
Address: 3100 Stevenson Drive, 2nd Floor Maintenance Building
City/State/Zip: Springfield IL 62712
Contact: Eric Staley Phone: (217) 757-8610
Email: eric.staley@cwlp.com Fax:

Samples on: ☐ ICE ☐ BLUE ICE ☐ NO ICE _____ °C
Preserved in: ☐ LAB ☐ FIELD FOR LAB USE ONLY
LAB NOTES:

Are these samples known to be involved in litigation? If yes, a surcharge will apply: ☐ Yes ☑ No
Are these samples known to be hazardous? ☐ Yes ☑ No
Are there any required reporting limits to be met on the requested analysis?. If yes, please provide limits in the comment section: ☑ Yes ☐ No Permit on file

Client Comments:
*elevations, pH, conductivity, temperature
**Sb As Se Tl (ICPMS) Ba Be B Cd Ca Cr Co Pb Li Hg Mo
Quarterly monitoring

PROJECT NAME/NUMBER
Ash Pond Monitoring Wells

SAMPLE COLLECTOR'S NAME
Justin Colp

RESULTS REQUESTED
☑ Standard ☐ 1-2 Day (100% Surcharge)
☐ Other _____ ☐ 3 Day (50% Surcharge)

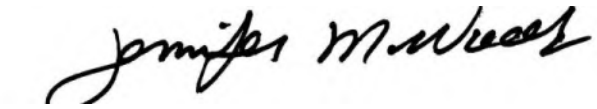
RE: 24050003

Order No.: 24051620

Dear Shelly Hennessy:



Summit Environmental Technologies, Inc. received 20 sample(s) on 5/17/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24051620**
Date: **6/12/2024**

CLIENT: TEKLAB Inc,
Project: 24050003

WorkOrder Narrative:
24051620: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence QC Notes:
LCS/LCSD-75651 Radium-228_NPW(904.0): LCS/LCSD exhibited a high RPD, individually each LCS/LCSD meets required criteria.
LCS/LCSD-75699 Radium-228_DW(904.0): LCS/LCSD exhibited a high RPD, individually each LCS/LCSD meets the required criteria.
LCS/LCSD-75740 Radium-226_DW(903.0): LCS/LCSD exhibit a high RPD, individually each LCS/LCSD meet required criteria.

Qualifiers and Acronyms

WO#: **24051620**
Date: **6/12/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

RE: FGDS Landfill **WorkOrder:** 24050002

Dear Eric Staley:

TEKLAB, INC received 11 samples on 5/13/2024 4:10:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: City Water, Light & Power
Work Order: 24050002
Client Project: FGDS Landfill
Report Date: 18-Jun-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

RE: 24050002

Dear Shelly Hennessy:

Order No.: 24051621

Summit Environmental Technologies, Inc. received 11 sample(s) on 5/17/2024 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

Quality control data is within laboratory defined or method specified acceptance limits except where noted.

If you have any questions regarding these tests results, please feel free to call the laboratory.

Sincerely,

Jennifer Woolf

Project Manager

Case Narrative

WO#: **24051621**
Date: **6/12/2024**

CLIENT: TEKLAB Inc,
Project: 24050002

WorkOrder Narrative:
24051621: This report in its entirety consists of the following documents: Cover Letter, Case Narrative, Analytical Results, QC Summary Report, Applicable Accreditation Information, Chain-of-Custody, Cooler Receipt Form, and other applicable forms as necessary. All documents contain the Summit Environmental Technologies, Inc., Work Order Number assigned to this report.

Summit Environmental Technologies, Inc., holds the accreditations/certifications listed at the bottom of the cover letter that may or may not pertain to this report. Please refer to the "Accreditation Program Analytes Report" for accredited analytes list.

The information contained in this analytical report is the sole property of Summit Environmental Technologies, Inc. and that of the customer. It cannot be reproduced in any form without the consent of Summit Environmental Technologies, Inc. or the customer for which this report was issued. The results contained in this report are only representative of the samples received. Conditions can vary at different times and at different sampling conditions. Summit Environmental Technologies, Inc. is not responsible for use or interpretation of the data included herein.

All results for Solid Samples are reported on an "as received" or "wet weight" basis unless indicated as "dry weight" using the "-dry" designation on the reporting units.

This report is believed to meet all of the requirements of the accrediting agency, where applicable. Any comments or problems with the analytical events associated with this report are noted below.

Analytical Sequence QC Notes:
LCS/LCSD-75740 Radium-226_DW(903.0): LCS/LCSD exhibit a high RPD, individually each LCS/LCSD meet required criteria.

Qualifiers and Acronyms

WO#: **24051621**
Date: **6/12/2024**

These commonly used Qualifiers and Acronyms may or may not be present in this report.

Qualifiers

U	The compound was analyzed for but was not detected above the MDL.
J	The reported value is greater than the Method Detection Limit but less than the Reporting Limit.
H	The hold time for sample preparation and/or analysis was exceeded. Not Clean Water Act compliant.
D	The result is reported from a dilution.
E	The result exceeded the linear range of the calibration or is estimated due to interference.
MC	The result is below the Minimum Compound Limit.
*****	The result exceeds the Regulatory Limit or Maximum Contamination Limit.
m	Manual integration was used to determine the area response.
d	Manual integration in which peak was deleted
N	The result is presumptive based on a Mass Spectral library search assuming a 1:1 response.
P	The second column confirmation exceeded 25% difference.
C	The result has been confirmed by GC/MS.
X	The result was not confirmed when GC/MS Analysis was performed.
B	The analyte was detected in the Method Blank at a concentration greater than the RL.
MB+	The analyte was detected in the Method Blank at a concentration greater than the MDL.
G	The ICB or CCB contained reportable amounts of analyte.
QC-/+	The CCV recovery failed low (-) or high (+).
R/QDR	The RPD was outside of accepted recovery limits.
QL-/+	The LCS or LCSD recovery failed low (-) or high (+).
QLR	The LCS/LCSD RPD was outside of accepted recovery limits.
QM-/+	The MS or MSD recovery failed low (-) or high (+).
QMR	The MS/MSD RPD was outside of accepted recovery limits.
QV-/+	The ICV recovery failed low (-) or high (+).
S	The spike result was outside of accepted recovery limits.
W	Samples were received outside temperature limits (0° – 6° C). Not Clean Water Act compliant.
Z	Deviation; A deviation from the method was performed; Please refer to the Case Narrative for additional information

Acronyms

ND	Not Detected	**RL**	Reporting Limit
QC	Quality Control	**MDL**	Method Detection Limit
MB	Method Blank	**LOD**	Level of Detection
LCS	Laboratory Control Sample	**LOQ**	Level of Quantitation
LCSD	Laboratory Control Sample Duplicate	**PQL**	Practical Quantitation Limit
QCS	Quality Control Sample	**CRQL**	Contract Required Quantitation Limit
DUP	Duplicate	**PL**	Permit Limit
MS	Matrix Spike	**RegLvl**	Regulatory Limit
MSD	Matrix Spike Duplicate	**MCL**	Maximum Contamination Limit
RPD	Relative Percent Different	**MinCL**	Minimum Compound Limit
ICV	Initial Calibration Verification	**RA**	Reanalysis
ICB	Initial Calibration Blank	**RE**	Reextraction
CCV	Continuing Calibration Verification	**TIC**	Tentatively Identified Compound
CCB	Continuing Calibration Blank	**RT**	Retention Time
RLC	Reporting Limit Check	**CF**	Calibration Factor

This list of Qualifiers and Acronyms reflects the most commonly utilized Qualifiers and Acronyms for reporting. Please refer to the Analytical Notes in the Case Narrative for any Qualifiers or Acronyms that do not appear in this list or for additional information regarding the use of these Qualifiers on reported data.

Comments: **Please Issue reports and invoices via email only**
Please analyze for Radium 226/228 per your usual methods.
Any changes to analysis/methods must be approved by Teklab, Inc. Batch QC is required.
Samples collected from an IL site.

Contact: Shelly Hennessy Email: shennessy@TekLabInc.com
Requested Due Date: Standard TAT Billing/PO: 36304 Phone: (618) 344-1004 ext. 36

PLEASE NOTE:

NELAP accreditation is required on the requested analytes and must be documented as such on the final report. If your laboratory does not currently hold a NELAP accreditation for the requested method and/or analytes, please contact Teklab immediately. If your laboratory loses accreditation or is suspended for any analyte/method during the life of the contract, you must contact Teklab immediately.

RE: Landfill Monitoring Wells G1-G2-G3 **WorkOrder:** 24050001

Dear Eric Staley:

TEKLAB, INC received 12 samples on 5/13/2024 4:10:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy
